## Inleiding

Zoals in het vorige jaarrapport beschreven was de belangrijkste gebeurtenis in 2011 de moedwillige lozing van een biocide c.q. afbraakproduct en hypochloriet, door de kerncentrale Leibstadt in Zwitserland. De reden was een noodzakelijk geachte desinfectiestap van de koeltoren om een legionellabesmetting te bestrijden. Diverse waterleidingbedrijven langs

*dr. Peter G. Stoks*

de Rijn zagen zich genoodzaakt de inname te staken en de lozing haalde zelfs de media in Noordrijn-Westfalen. Ook in Nederland is uit voorzorg bij een bedrijf de inname tijdelijk onderbroken. Niettemin gaf de kerncentrale aan dat zij, met goedkeuring van de desbetreffende Zwitserse instantie, ook in 2012 preventieve legionellabestrijdingen zouden doorvoeren; echter niet langer met biociden maar slechts met hypochloriet. Ook zouden de stroomafwaarts gelegen waterbedrijven tijdig gewaarschuwd worden. Als gevolg van deze gebeurtenis hebben de Rijnsoeverstaten afgesproken om te inventariseren hoe andere centrales hun koeltorens desinfecteren: legionellabesmetting zal immers niet alleen bij Leibstadt voorkomen. Bij het afsluiten van 2012 was over die inventarisatie echter nog niks bekend.

Ook in 2012 traden enkele plotselinge verontreinigingen op. Gelukkig leidden die slechts beperkt tot maatregelen bij waterbedrijven. Zo was er een plotselinge verontreiniging met het bestrijdingsmiddel metolachloor op het Rijntraject Karlsruhe – Worms in mei. Te Nieuwegein werd nog 0,3 µg/l gemeten, daarom heeft Waternet gedurende 4 dagen de inname beperkt.

Al meerdere jaren worden vooral tegen het eind van het jaar verhoogde gehalten van het onkruidbestrijdingsmiddel isoproturon aangetroffen. Gelukkig hebben die tot nu toe nog niet tot inname-problemen geleid maar RIWA-Rijn houdt deze stof scherp in de gaten: rond het begin van deze eeuw leidden verhoogde gehalten nog tot innamestops die wekenlang aanhielden! Aankaarten van die problematiek bij de Internationale Commissie ter Bescherming van de Rijn (ICBR) leidde toen tot een fikse daling. RIWA constateerde daaruit dat de door de ICBR opgestelde aanbevelingen kennelijk effect hadden. De toename van de laatste jaren geeft echter te denken of die aanbevelingen nog wel zo nauwgezet worden opgevolgd.

Na een aantal jaren van duidelijk lager dan gemiddelde afvoer was het jaar 2012 met 2230 m<sup>3</sup>/s weer normaal. Het 20-jarig voortschrijdend gemiddelde is 2233 m<sup>3</sup>/s. Dit zou eigenlijk gunstig moeten uitwerken op met name conservatieve stoffen; stoffen waarvan het gehalte enkel door lozing en verdunning wordt beïnvloed en niet door fysisch-chemische (omzettings) processen. Dit blijkt echter maar ten dele het geval: als gevolg van de grotere afvoer is de gemiddelde chlorideconcentratie dit jaar weliswaar lager dan vorig jaar, maar kennelijk wordt er tóch meer geloosd, omdat de vracht méér is toegenomen dan op grond van die hogere afvoer mocht worden verwacht. Ook bij sulfaat zien we al drie jaar op rij een stijgende maximumconcentratie, maar dit betreft telkens enkelvoudige waarnemingen die op grond van het gemiddelde beeld evengoed als uitschieter gekenmerkt kunnen worden.

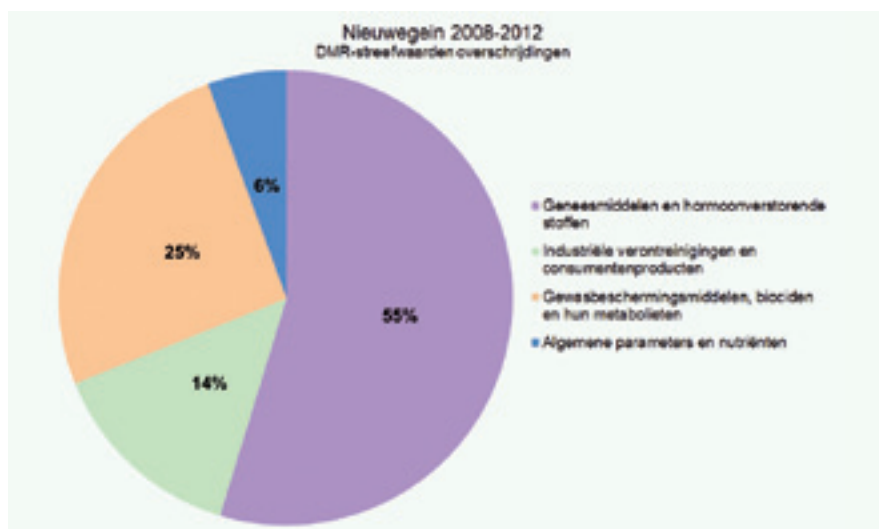

Over het algemeen vertonen de nutriënten en zware metalen daarentegen eenzelfde beeld als voorgaande jaren: een enkele overschrijding van wettelijke normen en/of van streefwaarden uit het Donau-, Maas- en Rijnmemorandum (DMR), maar over het algemeen een duidelijk gunstig niveau. Ook de complexvormers, zoals EDTA en DTPA, vertonen een, weliswaar behoorlijk afgezwakte, maar niettemin nog aanwezige neerwaartse tendens.

Het zeer brede palet aan organische microverontreinigingen dat door RIWA-Rijn wordt onderzocht, vertoont daarentegen een wisselend beeld. Zo wordt voor wat betreft bestrijdingsmiddelen en hun afbraakproducten nog wel een behoorlijk aantal overschrijdingen van de drempelwaarden uit het DMR-memorandum geconstateerd, en omdat die zowel qua aantal als qua niveau in dezelfde grootteorde als in voorgaande jaren liggen, is er bij die groep van stoffen weinig tot geen kwaliteitsverbetering merkbaar.

Daarentegen geeft de groep van industriechemicaliën over het algemeen weinig reden tot zorg. Daar zijn echter wel enkele specifieke uitzonderingen op, waaronder bijvoorbeeld 1,4-dioxaan, hexamethoxymethylmelamine en benzotriazol: deze stoffen overschrijden met grote regelmaat de streefwaarden van het DMR-memorandum. Een aantal van deze stoffen is door de IAWR, onze overkoepelende organisatie die het gehele Rijnstroomgebied afdekt, eind 2010 reeds bij de ICBR onder de aandacht gebracht. Anders dan enkele jaren geleden bij de industriële stof diglyme heeft dit echter vooralsnog geen duidelijke kwaliteitsverbetering opgeleverd.

Zorgelijk echter blijft al geruime tijd de verontreiniging met geneesmiddelen en hormoonverstorende stoffen. Zoals uit onderstaand diagram blijkt, wordt meer dan de helft van alle aangetroffen

overschrijdingen van de DMR-drempels te Nieuwegein veroorzaakt door juist deze groep van stoffen! Een vergelijkbaar beeld vertoont de Maas bij Keizersveer.

*Afbeelding 1: percentage overschrijdingen bij Nieuwegein binnen de diverse stofklassen (het totale aantal overschrijdingen bedraagt daar ruim 3,5 % van alle kwaliteitsmetingen).*

Ondanks uitdrukkelijke verzoeken van RIWA, reeds ten tijde van het totstandkomen van het BKMW (Besluit Kwaliteitseisen en Monitoring Water, 2009), ontbreken wettelijke normen nog steeds. Recente uitspraken van de overheid, ten tijde van een mede door KWR en STOWA georganiseerd symposium over de geneesmiddelenproblematiek in december, stemmen niet hoopvol: de overheid zet in op emissie-verminderende maatregelen, niet op normering. Het blijft uiteraard zeer de vraag of er bij gebrek aan normen voldoende “sense of urgency” zal ontstaan.

Ook internationaal stemmen de ontwikkelingen wat betreft geneesmiddelen en hormoonverstorende stoffen niet hoopvol: op Europees niveau wordt al jaren gediscussieerd over het al dan niet opnemen van slechts een drietal stoffen uit deze categorie op de lijst van Prioritaire Stoffen (één geneesmiddel en twee hormonen). Bij het afsluiten van het verslagjaar was de status dat zelfs dáárvoor geen kwaliteitsnormen zouden komen, maar dat de stoffen slechts op een zogenaamde “Watch List” zouden komen. Als de aanpak van de verontreiniging met geneesmiddelen in dit tempo doorgaat zal er niet snel zicht zijn op verbetering.

Overigens staan in de door RIWA aangereikte 14 probleemstoffen (zie Jaarrapport 2011) die inmiddels op de NL-Watchlist staan, negen geneesmiddelen. Van een viertal daarvan is door het Rijk dringend aanbevolen aan de waterschappen om te gaan meten.

Wél erg positief is de situatie met betrekking tot benzine-additieven: de al enkele jaren gangbare kwaliteitsverbetering heeft zich ook in 2012 doorgezet. Dankzij gezamenlijke inspanningen van EFOA, de Europese vereniging van producenten, van de Noordrijn-Westfaalse overheid en “Wasserschutzpolizei”, maar ook dankzij de inzet van de ICBR blijft het aantal – vooral plotselinge – verontreinigingen en de intensiteit daarvan verminderen. RIWA-Rijn spreekt dan ook haar erkentelijkheid uit voor de inzet van alle betrokkenen. In het vorige jaarverslag werd de verwachting uitgesproken dat de aanpak van deze toxicologisch volstrekt onschuldige verontreiniging ertoe zal aanzetten dat de ICBR zich ook voor andere onschuldige, maar voor de drinkwaterbereiding problematische stoffen zal inzetten. Inmiddels is een aantal van dergelijke, door de IAWR aangedragen verontreinigingen inderdaad op de officiële Rijnstoffenlijst geplaatst. Het is weliswaar nog onduidelijk welke toetsingscriteria gehanteerd zullen worden om de aangetroffen gehalten te beoordelen, maar dat daarbij al wel de in het DMR-memorandum gehanteerde drempelwaarden worden beschouwd is beslist een stap in de juiste richting.

# De kwaliteit van het Rijnwater in 2012

## Inleiding

In dit hoofdstuk staat de kwaliteit van het oppervlaktewater in het Rijnstroomgebied in het jaar 2012 centraal. De invalshoek bij de beoordeling van het oppervlaktewater is de geschiktheid van het water als bron voor de bereiding van drinkwater. Het beschouwde oppervlaktewater betreft vier locaties te weten: de Rijn bij Lobith, het Lekkanaal bij Nieuwegein, het Amsterdam-Rijnkanaal bij Nieuwersluis en het IJsselmeer bij Andijk. Op de laatste drie locaties wordt Rijnwater ingenomen voor de bereiding van drinkwater.

Door Vitens wordt oevergrondwater gewonnen langs de IJssel bij Zwolle. Oasen gebruikt langs de Rijntakken Merwede, Noord en Lek ook oeverfilteraat voor de drinkwaterproductie. Deze bedrijven hebben geen speciale meetstations rechtstreeks aan de Rijn. Omdat het onttrokken oevergrondwater indirect wel Rijnwater is, wordt dit water vanzelfsprekend wel uitgebreid geanalyseerd. In deze rapportage worden echter alleen de directe analyses van het Rijnwater beschreven.

In de bijlagen 1 tot en met 4 zijn de meetresultaten van de vier oppervlaktewaterlocaties als maandgemiddelden vermeld, samen met een aantal andere kengetallen over het jaar 2012. In dit hoofdstuk wordt, na een korte beschouwing over de DMR-streefwaarden (Donau- Maas en Rijnmemorandum 2008) en het RIWA-waterkwaliteitsmeetnet, een aantal opmerkelijke zaken en parameters apart besproken. Vanaf 2011 zijn de verschillende kwaliteitsparameters niet langer ingedeeld op grond van hun chemische structuur, maar veel meer ingedeeld in groepen op basis van hun toepassingsgebied. Dit bevordert de herkenbaarheid en kan mogelijk ook helpen bij het achterhalen van de herkomst. Het betekent echter wel dat parameters ten opzichte van voorgaande indelingen nu op een andere plaats kunnen staan en dat een parameter in meerdere groepen kan voorkomen. Nieuw is dat we de analyses die met een hoge frequentie worden uitgevoerd zoveel als mogelijk hebben ondergebracht in een aparte parametergroep, te weten “Dagelijkse screening / (semi)online”. Dit is gedaan omdat hiervoor vaak andere methoden worden gebruikt en dat noodzakelijkerwijs de validatie van de methode anders is geweest. Ook gelden vaak hogere (of helemaal geen) onderste analyse- of rapportagegrenzen.

### **Donau-, Maas- en Rijnmemorandum (DMR-memorandum)**

In 2008 is door de IAWR (Internationale Arbeitsgemeinschaft der Wasserwerke im Rheineinzugsgebiet) opnieuw een update van het Rijnmemorandum uit 1986 vastgesteld. Dit keer is in samenwerking met de IAWD (Internationale Arbeitsgemeinschaft der Wasserwerke im Donaeinzugsgebiet) en met RIWA-Maas (Vereniging van Rivierwaterbedrijven Maas/Meuse) een memorandum verschenen voor de stroomgebieden van de Maas, de Donau en de Rijn. Gezamenlijk vertegenwoordigen deze drie organisaties 106 miljoen consumenten in zeventien landen. Het betreft, voor de Rijn, de vijfde versie van dit document en bevat eisen voor een duurzame bescherming van de waterkwaliteit en concrete streefwaarden voor een aantal groepen van stoffen. De streefwaarden in dit memorandum zijn gedefinieerd als maximumwaarden (dit gezamenlijk memorandum is, als pdf bestand, te vinden op onze website: [www.riwa.org](http://www.riwa.org)) (zie ook hoofdstuk 2 in het jaarrapport 2008). Algemeen uitgangspunt van dit DMR-memorandum is dat voor veel stoffen reeds wettelijke normen bestaan. Voor veel stoffen, die juist vanuit de filosofie van eenvoudige zuivering problematisch zijn, bestaan echter nog geen wettelijke normen. Het DMR-memorandum richt zich specifiek op die stoffen c.q. stofgroepen. Onderkend wordt dat het DMR-memorandum geen wettelijke status heeft. Daarom worden de daarin aangegeven waarden in dit jaarrapport ook consequent als “streefwaarden” weergegeven.

In 2011 is een start gemaakt met een nieuwe versie van het memorandum, deze versie zal in de zomer van 2013 verschijnen.

### **Het RIWA-waterkwaliteitsmeetnet, RIWA-base**

Het RIWA-waterkwaliteitsmeetnet in het Rijnstroomgebied omvat in 2012 een viertal meetlocaties, te weten: Lobith, Nieuwegein (of Hagestein voor de afvoer), Andijk en Nieuwersluis. Naast het min of meer conventionele onderzoek van parameters wordt een uitgebreid pakket aan organische microverontreinigingen onderzocht, zoals farmaceutische middelen, hormoonverstorende componenten en – via screeningsonderzoek of via (inter-) nationale contacten – , andere nieuw in de belangstelling staande stoffen in het oppervlaktewater (emerging substances). Conform langlopende afspraken binnen de IAWR, onze overkoepelende organisatie binnen het gehele Rijnstroomgebied, worden de uit te voeren metingen onderscheiden in een z.g. basisprogramma met vaste meetfrequenties en vast omschreven parameters voor alle monsterpunten en een z.g. aanvullend programma, met periodiek wijzigbare parameters alléén op hoofd-monsterpunten. Lobith is één van die hoofd-

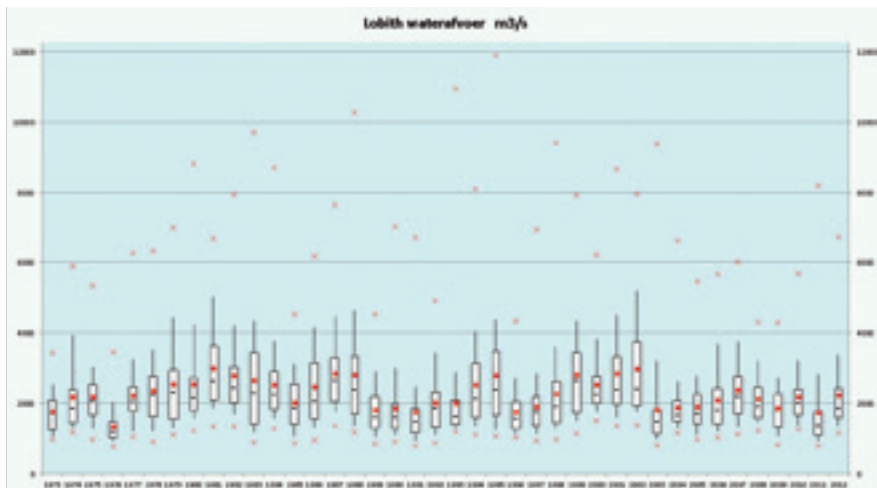

monsterpunten. Te Lobith wordt vooral de kwaliteit vastgesteld zoals het water Nederland binnenkomt. Het onderzoek naar de kwaliteit van het water in het Nederlandse deel van het Rijnstroomgebied wordt voornamelijk door Het Waterlaboratorium (HWL) en door de Rijkswaterstaat (RWS) Waterdienst uitgevoerd.

De analyse van de farmaceutische middelen, complexvormers, AOX, kunstmatige zoetstoffen en perfluorverbindingen op het monsterpunt Lobith is in 2012 door RIWA-Rijn evenals in voorgaande jaren ondergebracht bij het Technologie Zentrum Wasser (TZW) in Karlsruhe en voor een klein aantal parameters bij RheinEnergie in Keulen. De gegevens worden in een database (RIWA-base) opgeslagen. Ook worden in de RIWA-base alle meetreeksen onderzocht op overschrijdingen van streefwaarden en aan- c.q. afwezigheid van trends. De trends worden berekend met een 80% en een 95% betrouwbaarheid (zie voor uitleg van de werkwijze het rapport 30 jaar RIWA-base, mei 2012, beschikbaar op onze website). Met RWS Waterdienst heeft RIWA-Rijn een overeenkomst om gegevens van de diverse meetlocaties uit te wisselen, om dubbel analysewerk zoveel als mogelijk te voorkomen.

### Waterafvoer

De gemiddelde waterafvoer in 2012 van de Rijn te Lobith bedroeg 2230 m<sup>3</sup>/s (zie grafiek 1.1) en was daarmee fors hoger dan in voorgaande jaren en nu gelijk aan het voortschrijdend 20-jarige gemiddelde van 2233 m<sup>3</sup>/s. Dit voortschrijdende gemiddelde beweegt zich vanaf 1912 tussen 2000 en 2500 m<sup>3</sup>/s. Het 5-jarig voortschrijdend gemiddelde is 2029 m<sup>3</sup>/s.

Grafiek 1.1 waterafvoer Rijn te Lobith laatste 40 jaar

Grafiek 1.2 waterafvoer Rijn te Lobith en de Lek te Hagestein 2012

De waterafvoer te Lobith fluctueerde in 2012 tussen 1155 en 6732 m<sup>3</sup>/s, en was daarmee minder extreem dan in voorgaande jaren. In het verslagjaar toonde de afvoer weer het vertrouwde beeld met voorjaar- en najaar-pieken (zie grafiek 1.2).

Hagestein levert, voor wat betreft de waterafvoer, een vergelijkbaar beeld op als Lobith. De waarden lagen in 2012 tussen 0 en 1250 m<sup>3</sup>/s en het jaargemiddelde was 248 m<sup>3</sup>/s. Het 20-jarige respectievelijk het 5-jarige voortschrijdend gemiddelde is bij Hagestein 292 en 222 m<sup>3</sup>/s.

### Zuurgraad

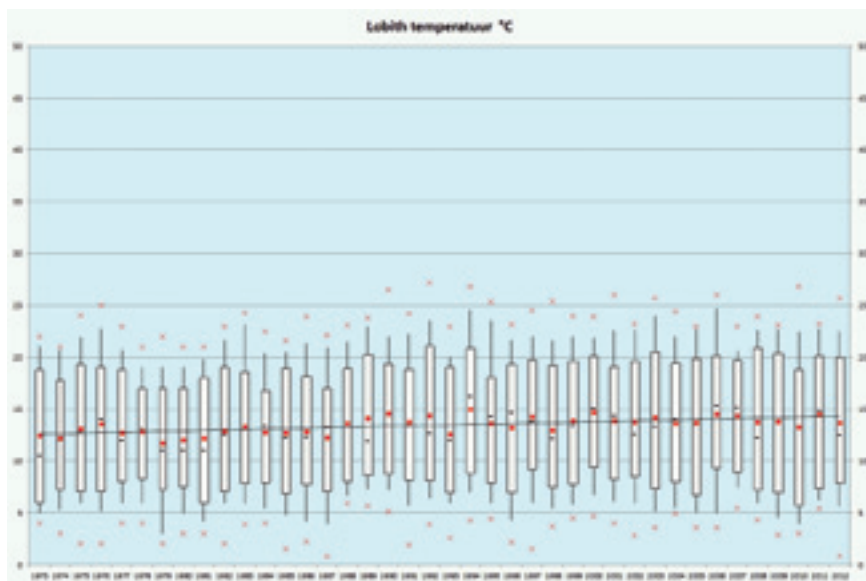

De stijging van de afgelopen jaren voor de zuurgraad zet zich niet voort. De zuurgraad is de afgelopen tientallen jaren gestegen in het Nederlandse gedeelte van het Rijnstroomgebied met uitzondering van het IJsselmeer bij Andijk. Al ruim dertig jaar lang stijgt de waarde heel geleidelijk. Alle gemeten waarden zijn in 2012 nog steeds onder de pH 9,00 (streefwaarde DMR-memorandum).

Figuur 1.1 Trend- en normalet van de zuurgraad over de afgelopen 12 jaar

Voor uitleg van de gebruikte pictogrammen zie pagina 216

Zoals vorige jaren aangegeven is de verhoging van de watertemperatuur in de loop der jaren waarschijnlijk de drijvende kracht achter dit fenomeen, hierdoor zal het chemisch evenwicht van verschillende processen alsmede de biologische activiteit veranderen, met als gevolg deze verhoging van de zuurgraad. In de metingen van de watertemperatuur waren in 2012 geen statistisch significante 5 jaar trends te detecteren. Niettemin is er wel een stijgende tendens, zie grafiek 1.3. De stijging in deze 40 jaar is 1,7 °C. De DMR-streefwaarde van 25 °C is bij Lobith ook overschreden.

*Grafiek 1.3 watertemperatuur te Lobith laatste 40 jaar, met de trendlijn*

### Anorganische stoffen

Ook in dit verslagjaar werd het water op de meetlocaties in het Rijnstroomgebied op een scala van anorganische stoffen onderzocht. Voor een aantal van deze stoffen is in het DMR-memorandum een streefwaarde opgenomen.

### Watersamenstelling

Tabel 1.1 (zie pagina 20) geeft een overzicht van een aantal extreme waarden (de hoogst gemeten waarden, voor zuurstof de laagst gemeten waarden) van het Rijnwater te Lobith, het Lekkanaalwater te Nieuwegein, het Amsterdam-Rijnkanaalwater te Nieuwersluis en het IJsselmeerwater te Andijk.

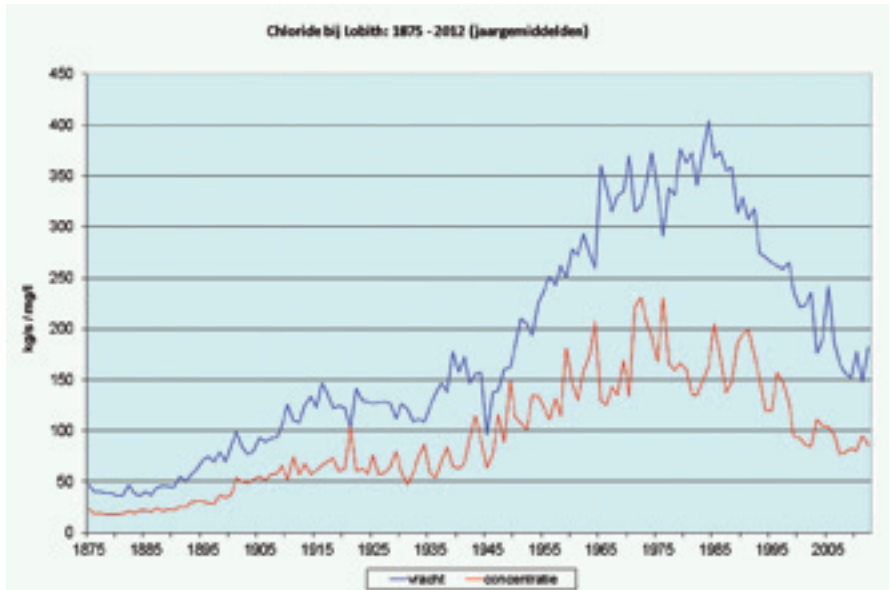

### Conservatieve anorganische stoffen

Stoffen als chloride, sulfaat, natrium, kalium en magnesium worden wel “conservatief” genoemd daar hun gehalte enkel door verdunning en lozing van de ionen wordt beïnvloed en niet door de fysisch-chemische of biologische processen die zich in rivier of meer afspelen. Het verloop van de gehalten van deze stoffen in water wordt dus hoofdzakelijk door de omvang van de lozingen en de afvoer bepaald.

## Chloride

De chloride concentratie bij Lobith laat opnieuw een significante stijging zien, ondanks de fors hogere afvoer. De vracht bij Lobith is met 182 kg/s (2011 was 148 kg/s) fors hoger.

De maxima te Lobith (117 mg/l) en Andijk (122 mg/l) zijn hoger dan de DMR streefwaarde van 100 mg/l. Nieuwegein (95 mg/l) en Nieuwersluis (91 mg/l) voldoen aan de DMR streefwaarde.

Grafiek 1.4 Weergave van het chloride verloop vanaf 1875 tot en met 2012 (jaargemiddelden)

## EGV

Ook voor EGV geldt dat het boven de streefwaarde van 70 mS/m uitkomt. Zowel Lobith als Andijk scoren met respectievelijk 73,3 en 72,3 eveneens boven de streefwaarde.

## Sulfaat

Een bijzonderheid is ook de overschrijding van de streefwaarde door sulfaat. Bij Lobith wordt een maximale concentratie gevonden van 101 mg/l. In 2011 was dat nog 87,9 mg/l en in 2010 was dat 79 mg/l. De streefwaarde voor sulfaat is 100 mg/l. De genoemde meetwaarden betreffen echter maxima die ten opzichte van de overige waarnemingen in de betreffende jaren duidelijk afwijken. Het kunnen dus evengoed uitschieters zijn. Navraag bovenstrooms

(Keulen) gaf geen vergelijkbare hoge waarden. Niettemin zal sulfaat de komende jaren kritisch gevolgd blijven worden.

### Zuurstofgehalte en zuurstofverzadiging

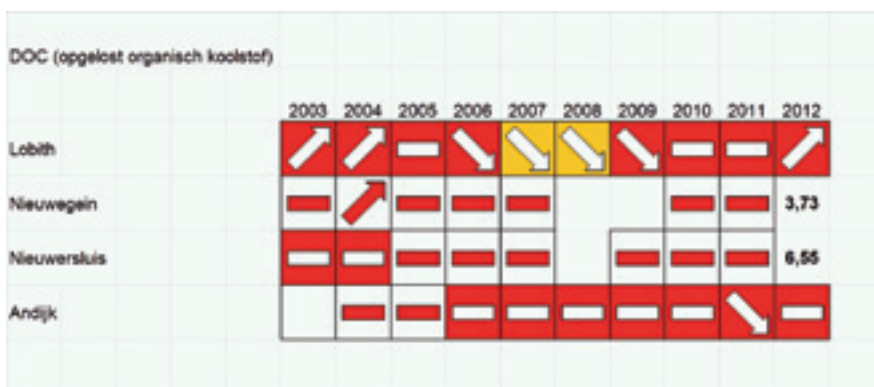

Het DMR-memorandum stelt als streefwaarde voor het zuurstofgehalte meer dan 8,0 mg/l. Bij Nieuwegein, Nieuwersluis en Andijk is het jaarminimum beneden deze waarde, bij Nieuwegein voldeed zelfs het 10 percentiel met een waarde van 7,36 mg/l niet aan de streefwaarde.

### Eutrofiërende stoffen (nutriënten)

Alleen Nieuwersluis geeft, evenals voorgaande jaren, met een maximum van 0,35 mg/l, een overschrijding van de streefwaarde voor ammonium (0,3 mg/l). Zie verder tabel 1.1 en de bijlagen 1 tot en met 4 vanaf pagina 64.

### Organische koolstof (TOC, DOC)

TOC (totaal organisch koolstof) en de gefiltreerde variant hiervan, DOC, zijn een niet specifieke indicator van de belasting van het water met organische stof. De maximumwaarden van de in 2012 verzamelde meetreeksen, voor zowel TOC als DOC, voldeden evenals dat in voorgaande jaren het geval was, op géén van de vier locaties aan de DMR streefwaarde (4 rep. 3 mg/l C). Zie voor de resultaten tabel 1.1 op pagina 20 en de bijlagen 1 t.e.m. 4 vanaf pagina 64. Alleen Lobith laat een stijgende trend zien voor DOC.

*Figuur 1.2 Trend- en normalet van de DOC over de afgelopen 10 jaar  
Voor uitleg van de gebruikte pictogrammen zie pagina 216*

Bij Nieuwersluis voldeed vorig jaar meer dan de helft van de metingen niet aan de streefwaarden. In 2012 is bij Nieuwegein en Nieuwersluis de meetreeks halverwege het jaar afgebroken, daardoor is het niet mogelijk om trends te detecteren. Echter de maximale waarnemingen voldeden evengoed niet aan de streefwaarde.

### Adsorbeerbare organische halogeenverbindingen (AOX)

In het rapportagejaar 2012 voldeed Lobith niet aan de DMR-streefwaarde (25 µg/l Cl), de hoogst gemeten waarde in Lobith is 38 µg/l. Nieuwegein en Nieuwersluis voldoen aan de DMR-streefwaarde en dalen significant.

### Adsorbeerbare organische zwavelverbindingen (AOS)

Deze groep van stoffen heeft een heel brede toepassing in diverse industrieën. Bijvoorbeeld als reagens in de chemische industrie, maar zwavelhoudende stoffen worden ook gevormd bij de afbraak van organisch materiaal. Zowel Andijk, Nieuwegein als Nieuwersluis hebben waarnemingen die ruim boven de DMR-streefwaarde scoren.

Grafiek 1.5 Adsorbeerbare organische zwavelverbindingen

### Cholinesteraseremmers (als paraoxon)

Deze parameter geeft een “overall”-waarde voor pesticiden (vooral organofosforpesticiden) die op het zenuwstelsel van de doel-organismen inwerken. Het betreft een effectparameter, omdat niet de gehalten, maar juist de werking van dergelijke pesticiden wordt gemeten, uitgedrukt in eenheden ten opzichte van een standaard (paraoxon). Een sterke werking betekent dus niet automatisch een hoog gehalte aan pesticiden. Omgekeerd betekent een geringere werking echter evenmin dat er ook een laag gehalte aan dergelijke pesticiden is. Hoewel strikt genomen niet correct, wordt deze parameter wel aan de DMR-streefwaarde voor pesticiden getoetst omdat het een globale indruk geeft van de aanwezigheid van dergelijke verontreinigingen. Op één innamepunt werd deze DMR streefwaarde overschreden met een maximum waarde van 0.2 µg/l. De onderste analysegrens ligt op de DMR-streefwaarde, en is daarmee eigenlijk niet nauwkeurig genoeg.

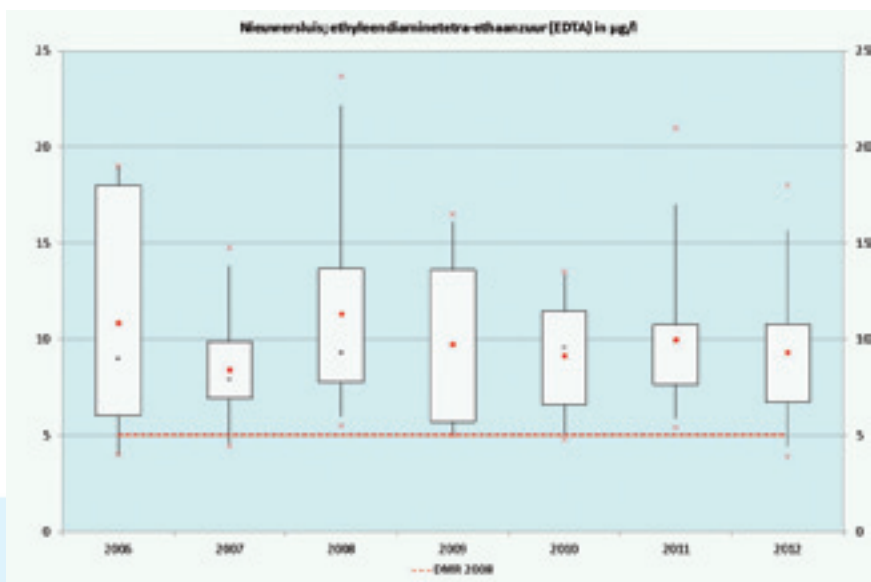

### Metalen

Deze groep van stoffen geeft bij geen der monsternamenpunten problemen. Het DMR-memorandum van 2008 geeft geen streefwaarden voor deze groep, aangezien er reeds wettelijke normen voor bestaan. De BKMW (Besluit Kwaliteitseisen en Monitoring Water) waarden worden ook niet overschreden. De zuiveringen van de drinkwaterbedrijven zijn goed in staat om de metalen relatief simpel uit het ingenomen water te verwijderen.

## Wasmiddelcomponenten en complexvormers

Deze groep van stoffen in het RIWA meetnet omvat o.a. de stoffen NTA, EDTA en DTPA. Hoewel de stoffen op zichzelf niet zeer toxisch zijn hebben ze door hun complexerend vermogen de eigenschap zware metalen uit slib vrij te maken en in water opgelost te houden, waardoor deze bij de drinkwaterbereiding moeilijker te verwijderen zijn. Maar ook komen daardoor bijvoorbeeld cadmium en kwik opnieuw beschikbaar voor allerlei aquatische organismen met alle gevolgen van dien. In het DMR-memorandum is een streefwaarde opgenomen voor slecht afbreekbare complexvormers (5 µg/l). Op alle vier de meetlocaties worden deze stoffen geanalyseerd. Bij alle locaties wordt met name EDTA ruim boven de drempel teruggevonden. Alleen bij Andijk is een neergaande trend gedetecteerd voor EDTA over de afgelopen 5 jaar. In het vorige jaarrapport werd op grond van de gesignaleerde dalende tendens gesuggereerd dat wellicht op termijn de uitzonderingspositie van deze groep stoffen in het DMR memorandum opgeheven zou kunnen worden. De resultaten van 2012 spreken dit weliswaar niet tegen, maar afgezien van EDTA bij Andijk, is die dalende tendens toch afgezwakt.

Grafiek 1.6 Boxplot van het ethyleendiaminetetra-ethaanzuur (EDTA) gehalte te Nieuwersluis  
Zie verder de bijlagen achter in dit rapport vanaf pagina 64.

## Organische microverontreinigingen

In tabel 1.1 zijn de maximale meetwaarden van individuele organische microverontreinigingen opgenomen waarvoor op één (of meerdere) meetlocaties in het Rijnstroomgebied niet aan de DMR-memorandum streefwaarde werd voldaan.

In de bijlagen opgenomen achter in dit jaarverslag, is het totaal aan stoffen, inclusief parameters die wel aan de DMR-streefwaarden voldeden, weergegeven.

*Tabel 1.1: Vergelijking van de kwaliteit van het oppervlaktewater in het Rijnstroomgebied met de DMR-streefwaarde. In de tabel is de hoogst gemeten waarde weergegeven indien de parameter de DMR-streefwaarde heeft overschreden.*

|   | dimensie | DMR-2008 | Lobith | Nieuwegein | Andijk | Nieuwersluis |
|---|----------|----------|--------|------------|--------|--------------|
| <b>Algemene parameters</b>                      |          |          |        |            |        |              |
| zuurstof  | mg/l     | 8        |        | 7          | 7.8    | 7.7          |

Tabel 1.2: Voor een aantal stoffen is de door de laboratoria gehanteerde rapportagegrens ongeschikt om aan de DMR-streefwaarden te toetsen. Tenzij deze rapportagegrens wordt verlaagd, is de meting in feite zonde van het geld en kan net zo goed achterwege blijven. Het betreft de navolgende stoffen:

"-" geen meetgegevens; \*) normtoetsing onmogelijk; leeg vakje: geen overschrijdingen

### **Monocyclische aromatische koolwaterstoffen (MAK's)**

Dit betreft een zeer uitgebreide groep stoffen waarvan een aantal uit benzine afkomstig is. Van deze groep werden en worden veel gegevens verzameld, soms ook met behulp van zogenaamde “dagelijkse screening of (semi)online” metingen. De gedetecteerde trends worden over het algemeen veroorzaakt door het wijzigen van de rapportage grenzen door de laboratoria. Op de vier monsternamenpunten zijn in totaal 97 reeksen onderzocht. Er is een overschrijding bij Lobith gevonden voor ethenylbenzeen (styreen) met een waarde van 1,61 µg/l. Verder is bij Lobith voor één parameter (3-chloormethylbenzeen) een dermate hoge rapportage grens dat daarmee niet is te constateren of er overschrijdingen zijn. Verder zijn alle waarnemingen onder de streefwaarden gerapporteerd.

Zie de bijlagen 1 tot en met 4 achter in dit rapport en tabel 1.1

### **Polycyclische aromatische koolwaterstoffen (PAK's)**

Polycyclische aromatische koolwaterstoffen komen vooral vrij bij verbrandingsprocessen, bijvoorbeeld bij verbranding van fossiele brandstoffen en van afval. Atmosferische depositie is daardoor een belangrijke bron van waterverontreiniging. Ook het verkeer, vooral dat met dieselmotoren, produceert aanzienlijke hoeveelheden PAK's. PAK's komen ook in teerproducten voor. Daar deze onder andere worden toegepast bij wegbedekking, hout conservering, scheepsbouw, waterbouw en bekleding van buizen en vaten, komen ook op deze wijze PAK's in het oppervlaktewater terecht. Er werd geen enkele overschrijding van de streefwaarde geconstateerd bij in totaal 737 analyses in 2012, waarvan 443 reële getallen onder de streefwaarde, maar boven de onderste analysegrens.

Zie de bijlagen 1 tot en met 4 op pagina 64 en volgende.

### **Organochloorbestrijdingsmiddelen (OCB's)**

Deze grote groep stoffen is zeer uitgebreid geanalyseerd. In totaal werden op de 4 locaties 1349 analyses verricht, waarvan 122 reële getallen onder de streefwaarde, maar boven de onderste analysegrens. Er werd geen enkele overschrijding van de streefwaarde geconstateerd, wel werden op de verschillende locaties in totaal 2 parameters (3-chloorpropeen en dicofol) met een dermate hoge rapportage grens gerapporteerd dat daarmee niet is te constateren of er overschrijdingen zijn. De gedetecteerde trends worden over het algemeen veroorzaakt door het wijzigen van de rapportage grenzen door de laboratoria.

Zie bijlage 1 op pagina 64 en volgende.

### Organofosfor- en organozwavelpesticiden

In totaal werden in deze parametergroep 3219 waarnemingen gedaan, waarvan 175 reële getallen en 90 overschrijdingen van de DMR-streefwaarde. Deze overschrijdingen werden voornamelijk door AMPA en glyfosaat veroorzaakt.

Glyfosaat is de werkzame stof in nogal wat, ook voor particulieren breed verkrijgbare, onkruidbestrijdingsmiddelen. In 2011 heeft de Tweede Kamer een motie aangenomen (motie Grashoff) teneinde de milieubelasting met glyfosaat te verminderen. Omdat met deze motie niet alle toepassingen worden aangepakt, dringt Vewin bij de overheid sindsdien aan op een totaalverbod. Bij de meetlocaties Lobith en Nieuwersluis kwamen de hoogste waarnemingen voor (respectievelijk 0.11 en 0.12 µg/l) beide boven de DMR-streefwaarde. Bij de overige monsterlocaties zijn geen overschrijdingen van de streefwaarde geconstateerd.

Ook de verbinding aminomethylfosfonzuur, beter bekend als AMPA (een afbraakproduct van glyfosaat) overschrijdt nog steeds fors de DMR-streefwaarde, in Andijk een maximum gehalte van 0.30 µg/l, maar bij de andere drie monsternamenpunten met meer dan 5 maal de streefwaarde: Lobith 0.54 µg/l, Nieuwegein en Nieuwersluis beide 0.70 µg/l. In deze groep komt nu ook een andere stof (nicosulfuron) voor met een overschrijding van de DMR streefwaarde, de hoogste waarneming in 2012 was 0.20 µg/l bij Nieuwersluis.

Zie bijlage 1 op pagina 64 en volgende.

### Organostikstofpesticiden

Van de onderzochte pesticiden behorende tot de groep organostikstof zijn in totaal 745 rapportages gedaan, waarvan 13 reële getallen. Azoxystrobin heeft voor 3 locaties een te hoge rapportagegrens om te kunnen toetsen. Verder zijn geen overschrijdingen geconstateerd.

Zie bijlage 1 op pagina 64 en volgende.

### Chloorfenoxyherbiciden

Chloorfenoxyherbiciden vormen een groep van chloorhoudende onkruidbestrijdingsmiddelen met als bekendste vertegenwoordigers MCPA, MCPP en 2,4-D. Ook hier een beeld als bij de aromatische stikstofverbindingen en de PAK's, geen overschrijdingen en slechts 17 reële waarnemingen bij in totaal 388 analyses in 2012.

### Fenylureumherbiciden

In totaal werden in deze parametergroep 1662 waarnemingen gedaan, waarvan 94 reële getallen en geen overschrijdingen van de DMR-streefwaarde. Van de onderzochte pesticiden behorende tot de groep fenylureumherbiciden is de meest bekende isoproturon. In het verleden werden nog regelmatig isoproturonwaarden gemeten boven de 0.1 µg/l DMR streefwaarde, maar aanbevelingen die de Internationale Commissie tot Bescherming van de Rijn (ICBR) heeft opgesteld naar aanleiding van dergelijke overschrijdingen blijken kennelijk doeltreffend te zijn. Niettemin worden de laatste jaren regelmatig, vooral in de maanden november en december, bovenstrooms van Lobith nog wel verhogingen aangetroffen, deze hebben gelukkig geen gevolgen gehad voor wat betreft de waterinname in Nederland.

### Dinitrofenolherbiciden

Sinds 1992 wordt oppervlaktewater onderzocht op de aanwezigheid van dinitrofenolen. De onderzochte stoffen zijn o.a. DNOC, dinoseb en dinoterb, deze worden vooral ingezet als onkruidbestrijdingsmiddelen en als loofdoders bij de aardappelteelt.

De stoffen zijn op alle locaties onderzocht, er zijn geen overschrijdingen geconstateerd tijdens 221 analyses op deze parameters, alle beneden de onderste analysegrens en ook onder de DMR-streefwaarde.

### Herbiciden (overige)

Van ruim 1600 waarnemingen is geen enkele overschrijding geconstateerd. De maximale waarnemingen zijn alle onder 50% van de DMR-streefwaarde.

### Carbamaat bestrijdingsmiddelen

Sinds 1995 wordt oppervlaktewater onderzocht op de aanwezigheid van deze groep van stoffen. De stoffen zijn op alle locaties onderzocht, er zijn geen overschrijdingen geconstateerd tijdens 1569 analyses op deze parameters en geen reële waarnemingen boven de detectiegrens. Een parameter, butocarboxim, wordt gerapporteerd met een onderste analysegrens die gelijk is aan de DMR-streefwaarde, deze 41 waarnemingen kunnen daarmee niet getoetst worden.

## Biociden

Sinds 1996 wordt oppervlaktewater onderzocht op de aanwezigheid van deze groep van stoffen. Een bekende in deze groep is bijvoorbeeld DEET (diethyltoluamide). De stoffen zijn op alle locaties onderzocht, er zijn geen overschrijdingen geconstateerd tijdens 409 analyses op deze parameters waarvan slechts 125 reële waarnemingen boven een detectiegrens.

## Fungiciden (alle onderverdelingen)

Van de in totaal 2273 metingen binnen deze groepen zijn slecht 125 reële waarnemingen, waarvan de hoogste waarde 0.07 µg/l is. Verder valt het op dat een groot aantal metingen (142 waarnemingen) een onderste rapportage grens kent van op, tot zeer ruim boven de DMR streefwaarde. Het verdient aanbeveling dat voor deze groep van stoffen de analysemethode wordt verbeterd.

## Insecticiden

Sinds 2005 wordt oppervlaktewater onderzocht op de aanwezigheid van deze groep van stoffen. De stoffen zijn op alle locaties onderzocht, er zijn geen overschrijdingen geconstateerd tijdens 2288 analyses op deze parameters waarvan 22 reële waarnemingen boven de detectiegrens maar onder de DMR-streefwaarde. Een parameter, dicofol, wordt gerapporteerd met een onderste analysegrens die groter is dan de DMR-streefwaarde, deze 39 waarnemingen kunnen daarmee niet getoetst worden.

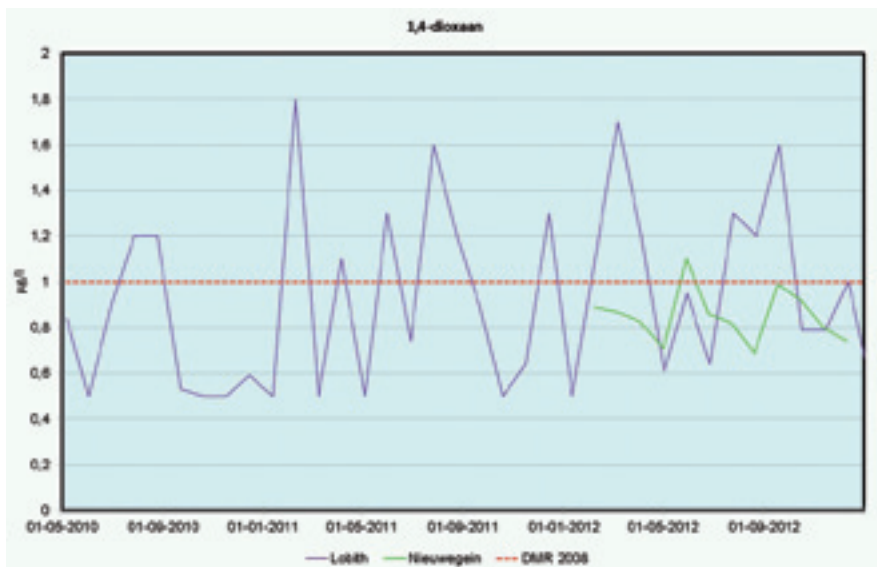

## Overige bestrijdingsmiddelen en metabolieten

Sinds 1995 wordt oppervlaktewater onderzocht op de aanwezigheid van deze grote groep van stoffen. De stoffen zijn op alle locaties onderzocht, er zijn geen overschrijdingen geconstateerd tijdens 2613 analyses op deze parameters waarvan slechts 20 reële waarnemingen boven de detectiegrens. Daminozide en iprodion hebben voor 3 locaties een te hoge rapportagegrens om te kunnen toetsen. En dan nog pyrifenox en tetramethrin hebben een onderste analysegrens op of boven de DMR-streefwaarde van 0,1 µg/l.

## Ethers (waaronder benzineadditieven)

In deze stofgroep zijn o.a. de stoffen MTBE, ETBE, TAME, diglyme en triglyme ingedeeld. De metingen van MTBE en ETBE laten, net zoals voorgaande jaren, een dalende trend zien bij Lobith. De inspanningen van de EFOA, de Europese vereniging van producenten, alsmede van de Noordrijn-Westfaalse overheid en “Wasserschutzpolizei”, waarover in voorgaande jaarrapporten reeds is gerapporteerd, hebben dus duidelijk effect. Echter bij de resultaten

van de dagelijkse screening worden af en toe nog kortdurende pieken gedetecteerd, met voor MTBE bij Lobith een maximale waarde van 4.02 µg/l. Dit toont aan dat de incidentele verontreinigingen met dergelijke ethers nog niet geheel tot het verleden behoren. De gehalten van di-, tri- en tetraglyme zijn alle onder de DMR-streefwaarde.

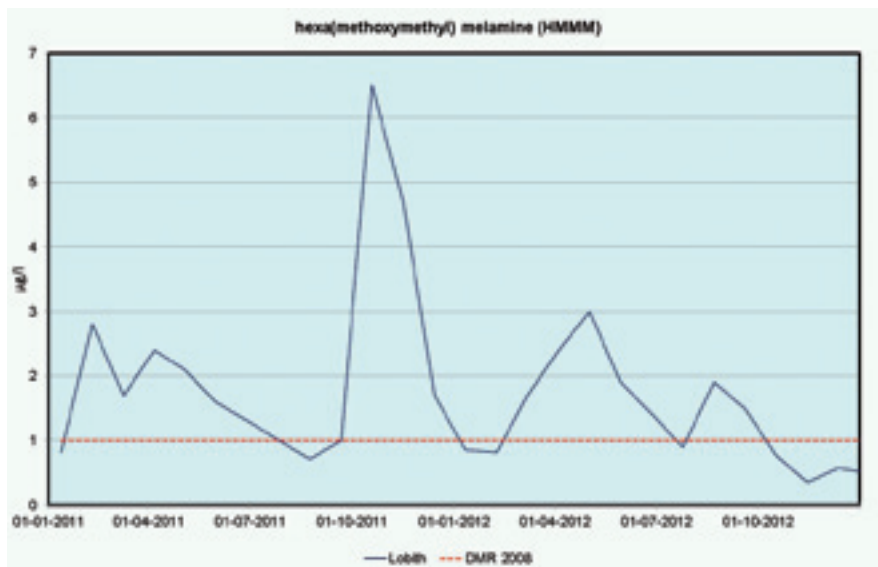

Grafiek 1.7 het verloop van 1,4-dioxaan te Lobith vanaf 2010

Opvallend zijn nog steeds de waarden voor 1,4-dioxaan gemeten bij Lobith. Vanwege de korte meetreeks is er trendmatig nog niets over te zeggen, wel is duidelijk dat de gemeten gehalten aanzienlijk zijn en regelmatig boven de DMR streefwaarde van 1 µg/l liggen. 1,4-dioxaan wordt onder andere gebruikt als oplosmiddel voor inkt en lijmen, het is goed in water oplosbaar en is moeilijk biologisch afbreekbaar. Eind 2010 heeft de IAWR deze stof, samen met nog enkele andere, bij de ICBR gepresenteerd als nieuwe probleemstof, niet in de laatste plaats omdat er in de wetenschappelijke literatuur onduidelijkheid is omtrent eventuele toxische effecten.

## Overige organische stoffen

Hexa(methoxymethyl) melamine (HMMM) wordt gebruikt in de coating industrie en wordt o.a. toegepast als cross-linker voor watergedragen verven.

In deze parametergroep zit ook benzotriazool, hiervan is een stijgende trend bij Lobith gedetecteerd. De maximale waarneming is 1,20 µg/l en is daarmee hoger dan de streefwaarde.

Grafiek 1.8 Hexa(methoxymethyl)melamine (HMMM) verloop te Lobith vanaf 2011

## Industriële oplosmiddelen

Er zijn 2 stoffen (dichloormethaan en 1,1,2,2-tetrachloorethaan) die bij Lobith worden gemeten, echter met een rapportagegrens boven (en ook ver boven) de DMR streefwaarde, zodat overschrijdingen niet geconstateerd kunnen worden. Bij de overige 3 locaties geeft Nieuwersluis een overschrijding voor tetrachlooretheen (0,2 µg/l), verder zijn geen overschrijdingen geconstateerd.

## Industriechemicaliën (met -per-fluor groepen)

Een grote groep stoffen binnen deze categorie is gemeten bij Lobith en Nieuwegein, er zijn hier geen overschrijdingen geconstateerd. Van de in totaal 728 metingen binnen deze

groepen zijn slechts 143 reële waarnemingen, waarvan de hoogste waarde 0,04 µg/l is. Verder valt het op dat een groot aantal metingen (156 waarnemingen) een onderste rapportage grens kent van op tot zeer ruim boven de DMR streefwaarde.

#### **Industriechemicaliën (met gehalog. zuren)**

Er zijn 2 stoffen (monochloorazijnzuur, monobroomazijnzuur) die bij Nieuwegein, Nieuwersluis en Andijk worden gemeten, echter met een rapportagegrens boven de DMR streefwaarde, zodat overschrijdingen niet geconstateerd kunnen worden. Monochloorazijnzuur bij Nieuwersluis had in het verslagjaar een maximale waarneming van 0,80 µg/l. Bij alle 4 de locaties werd trichloorazijnzuur (TCA) gemeten met maxima van 0.11 – 0,82 µg/l. Verder valt het op dat een groot aantal metingen (143 waarnemingen) een onderste rapportage grens kent van op tot zeer ruim boven de DMR streefwaarde.

#### **Industriechemicaliën (met fenolen)**

Er worden 16 verschillende stoffen in deze groep gemeten, er zijn enkele overschrijdingen geconstateerd. Van deze groep zijn 3 stoffen (2-chloorfenol, 3-chloorfenol, 4-chloorfenol) bij Lobith en Nieuwersluis gemeten met een rapportagegrens boven de DMR streefwaarde. Verder valt op dat een waarneming bij Andijk voor dichloorfenol een waarde heeft van 7,0 µg/l. Onduidelijk is of het hier om een meet- of rapportagefout gaat, of dat het een werkelijk gemeten (forse) overschrijding betreft. Zie de bijlagen 1 tot en met 4 achter in dit rapport.

#### **Industriechemicaliën (met PCB's)**

Deze groep stoffen is gemeten bij alle vier locaties, in totaal zijn er 368 analyses uitgevoerd. Er zijn geen overschrijdingen geconstateerd. De geconstateerde trends zijn te verklaren uit gewijzigde onderste analysegrenzen.

#### **Industriechemicaliën (met sulfonaten)**

Deze stoffen worden o.a. gebruikt bij de synthese van geneesmiddelen, maar bijvoorbeeld ook in de bouw (cement). Voor een overzicht wordt verwezen naar de desbetreffende RIWA-studie uit 2006.

Op grond van die studie en van oriënterende metingen die te Lobith zijn uitgevoerd, bleek binnen enkele jaren al duidelijk dat die stoffen nauwelijks relevant waren (nagenoeg geen overschrijdingen van de DMR streefwaarde). Daarom zijn die metingen bij Lobith weer gestopt.

De huidige metingen bij Nieuwegein en Nieuwersluis, met maxima tot ca. 0,6 µg/l bevestigen die eerdere tendens nog steeds. De lage frequentie van die metingen (4x per jaar) maken echter een normtoetsing en statistisch betrouwbare trendanalyse niet mogelijk: daarvoor zijn minimaal 10 waarnemingen vereist. Een andere (chloorhoudende) stof in deze groep is 2-amino-5-chloor-4-methylbenzeensulfonaat, deze heeft een DMR-streefwaarde van 0,1 µg/l. Voor deze stof is echter de onderste analysegrens te hoog om een eventuele overschrijding te kunnen detecteren. Zie de bijlagen 1 tot en met 4 achter in dit rapport.

### **Desinfectiemiddelen en bijproducten**

Alleen tribroommethaan werd bij Andijk aangetroffen met een maximum waarde van 0.10 µg/l. Er zijn geen overschrijdingen gevonden. Ook hier zijn de rapportagegrenzen niet afdoende voor een juiste toetsing.

### **Brandvertragende middelen**

Op alle 4 de locaties is deze grote groep stoffen gemeten, er zijn geen overschrijdingen geconstateerd tijdens 459 analyses op deze parameters. Slechts 5 reële waarnemingen boven de detectiegrens. Verder zijn alle uitslagen gelijk aan de onderste analysegrens.

### **Farmaceutische middelen**

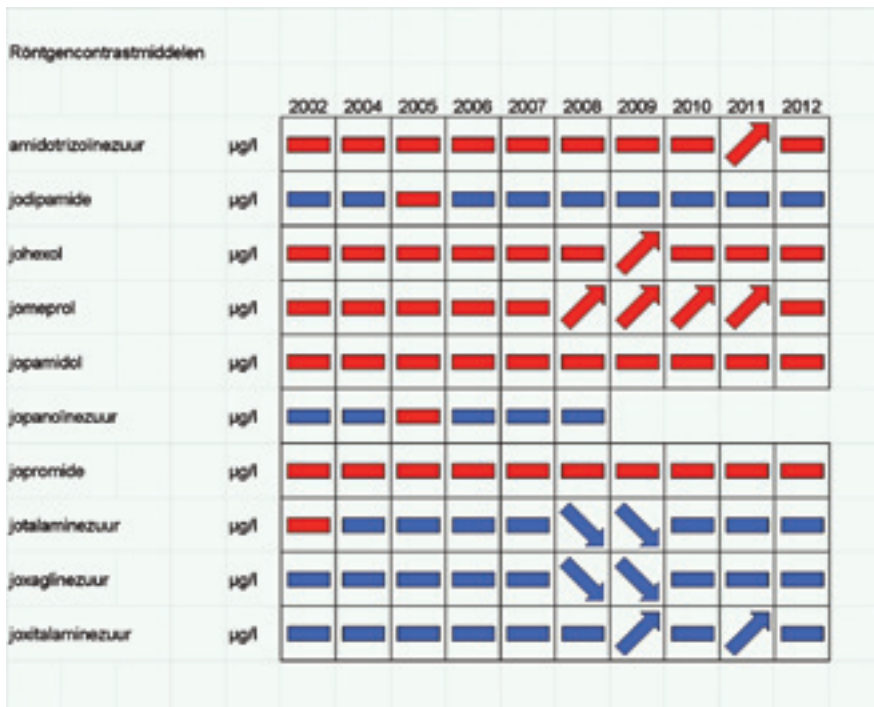

Een uitgebreide selectie van deze stoffen wordt sinds 2004 gemeten bij het monsterpunt Lobith. De selectie omvat vertegenwoordigers van antibiotica, penicillinen, pijnstillers, koortsverlagende middelen, anti-epileptica, cholesterolverlagende middelen, bloedverdunners en röntgencontrastmiddelen. Strikt genomen zijn röntgencontrastmiddelen geen farmaceutica, maar omdat ze in de gezondheidszorg veelvuldig worden toegepast worden ze hier bij deze stofgroep ingedeeld. Alle stoffen worden op grote schaal gebruikt, óók in de intensieve veehouderij en komen via de RWZI's en afspoeling in het oppervlaktewater. Bij een groot aantal stofgroepen binnen de hoofdgroep van farmaceutische middelen, laten de diverse parameters de nodige overschrijdingen zien van de DMR-streefwaarde.

Zie hiervoor tabel 1.1 en de bijlagen een tot en met vier achter in dit rapport.

In 2010 is een rapport gepubliceerd over de trends, concentraties van farmaceutische middelen in het Rijnstroomgebied in relatie tot de consumptie daarvan, dit rapport is beschikbaar op onze website.

## Röntgencontrastmiddelen

Met name de röntgencontrastmiddelen bevonden zich in 2012, evenals in voorgaande jaren, met grote regelmaat en bij alle monsterlocaties boven de DMR-streefwaarde van 0,1 µg/l. Zie hiervoor tabel 1.1 en de bijlagen een tot en met vier achter in dit rapport.

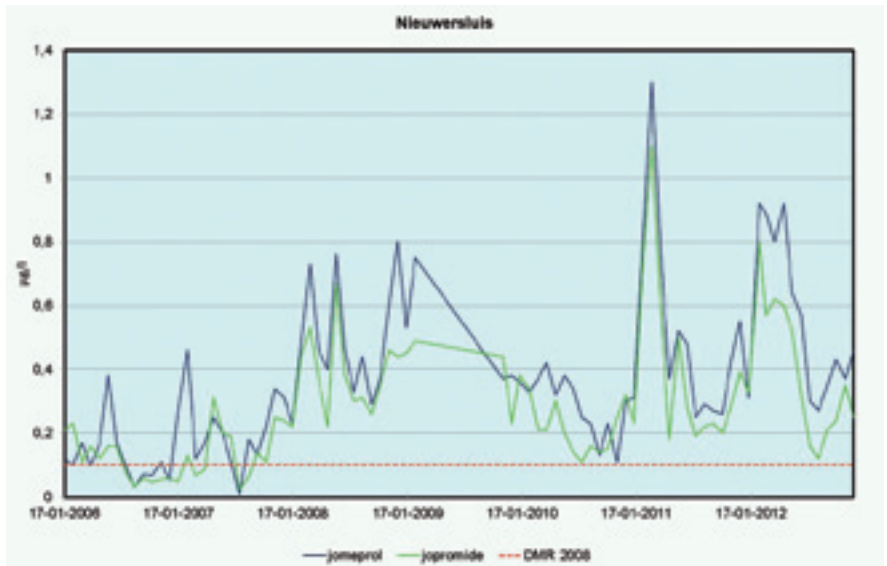

Figuur 1.3 Trend- en normalet van Lobith over de periode 2002 – 2012.

Voor uitleg van de gebruikte pictogrammen zie pagina xxx

Verontrustend is de blijvend stijgende trend voor jomeprol te Lobith, het maximum gehalte in 2012 bedraagt 1,0 µg/l en was daarmee opnieuw hoger dan in vorige jaren. Van twee andere stoffen is de trend ook stijgend. 202 van de in totaal 468 waarnemingen zijn op of boven de DMR-streefwaarde! Hierbij valt vooral Nieuwersluis negatief op.

Hoewel joxitalaminezuur nog niet de streefwaarde overschrijdt is de toename van de gehalten bedreigend.

Grafiek 1.9 jomeprol en jopromide bij Nieuwersluis

Ook amidotrizoïnezuur vertoont dit jaar een significante stijging, het maximum bedroeg bij Lobith respectievelijk Nieuwegein 0,53 en 0,52 µg/l (meer dan 5 maal de DMR streefwaarde). Jopamidol heeft een hoogste waarneming van 0,96 µg/l bij Nieuwersluis.

Zie tabel 1.1 voor alle andere overschrijdingen en bijlage 1 tot en met 4.

### Cytostatica

Een tweetal stoffen in deze groep, te weten cyclofosfamide en ifosfamide, wordt in deze parametergroep geanalyseerd. De maximale waarneming is 0,0008 µg/l, er zijn 78 waarnemingen gedaan in 2012 op de drie innamepunten. Geprobeerd wordt om vanaf 2013 het scala aan cytostatica binnen deze groep uit te breiden.

### Antibiotica

Binnen deze groep wordt hydrochloorthiazide aangetoond boven de DMR streefwaarde, bij Nieuwersluis met een maximum van 0,11 µg/l en bij Nieuwegein met een maximum van 0,13 µg/l. Een andere stof met waarnemingen boven de streefwaarde is Tiamuline, bij Nieuwersluis met een waarde van 0,12 µg/l. Voor de overige metingen bij de innamepunten worden geen overschrijdingen geconstateerd. Te Lobith wordt alleen indometacine gemeten, ook zonder overschrijding van de DMR streefwaarde.

### Antibiotica (met sulfamides)

De stoffen in deze groep zijn alleen gemeten te Nieuwegein en wel met een frequentie van 4 per jaar en een rapportagegrens van 1 µg/l. Zinnvolle interpretatie van de gegevens is niet mogelijk. Dit is vorig verslagjaar ook al geconstateerd.

In 2012 werd een onderzoek uitgevoerd waarbij via een soort effect-gerichte methode voor diverse klassen van antibiotica metingen worden verricht; naast sulfonamides worden bv. ook macroliden en tetracyclinen onderzocht (zie ook het hoofdstuk “Lopend en nieuw onderzoek” in dit jaarrapport). De rapportage daarvan zal separaat verschijnen in 2013. Vooruitlopend daarop kan al worden aangegeven dat zowel bij Lobith als bij Nieuwegein sulfonamide-activiteit is gevonden, maar omdat de voornoemde stofspecifieke methode veel te ongevoelig is, kan niet worden afgeleid welke sulfonamiden het bij die activiteit betreft.

### Bèta blokkers

Bèta blokkers reguleren de hartslag en zijn bloeddrukverlagend en worden veel toegepast. Er is een overschrijding te Lobith van metoprolol met een maximum waarneming van 0,12 µg/l, ook is de trend significant omhoog over de afgelopen 5 jaren. Ook propranolol bij Nieuwersluis met een waarde van 0,11 µg/l overschrijdt de DMR-streefwaarde. Verder zijn er geen overschrijdingen, ook niet op de andere monsternamenpunten.

### Pijnstillende- en koortsverlagende middelen

Diclofenac, pijnstillend en ontstekingsremmer, wordt te Lobith en Nieuwegein boven de streefwaarde van 0,1 µg/l aangetroffen, respectievelijk 0,11 en 0,27 µg/l. Verder is bij Nieuwegein salicylzuur met een gehalte van 0,13 µg/l aangetroffen. Overigens zijn er in deze groep geen overschrijdingen geconstateerd, ook niet op de andere monsterpunten.

### Antidepressiva en verdovende middelen

Alle stoffen in deze groep zijn alle onder de DMR streefwaarde gemeten. Te Lobith is niet naar deze stoffen gekeken.

### Cholesterolverlagende middelen

Te Nieuwegein werd binnen deze stofgroep een verbinding aangetoond op de DMR-streefwaarde van 0,1 µg/l, te weten gemfibrozil. De overige metingen voldoen aan de DMR-streefwaarde, waarbij opgemerkt dient te worden dat clofibraat gemeten wordt met een onderste analysegrens juist onder de streefwaarde, namelijk 0,085 µg/l.

### Overige farmaceutische middelen

Van metformine zijn nog maar korte meetreeksen beschikbaar. Dit medicijn, toegepast bij de behandeling van diabetes type 2, wordt bij deze 3 monsternamepunten zeer ruim boven de streefwaarde aangetroffen, te weten: - Nieuwegein 3,2 - Nieuwersluis 2,0 - Lobith 1,6 en Andijk 0,99 µg/l.

Grafiek 1.10 verloop van metformine vanaf juni 2010

Van metformine wordt ook de metaboliet gemeten, deze stof is bekend onder de namen Diaminomethylideneureum en Guanylureum. De gehalten zijn ook van deze stof aanzienlijk, zie grafiek 1.11

Grafiek 1.11 verloop bij Lobith van Guanylfureum

### Hormoonverstorende stoffen (EDC's)

Hormoonverstoring bij zowel mens als dier kan worden veroorzaakt door, meestal organische, microverontreinigingen. De stofgroep is zeer heterogeen, met als gemeenschappelijke eigenschap dat ze de hormonale werking kunnen verstoren. Zij kunnen aanzienlijke schade aanrichten aan de voortplantingsorganen van organismen, maar kunnen ook gedragsveranderingen veroorzaken.

Een onderscheid kan gemaakt worden tussen de kunstmatige, synthetische hormoonverstoorders, de zogenaamde xeno-oestrogenen, dit kunnen allerlei stoffen zijn, zoals: brandvertragers, landbouwchemicaliën, oplosmiddelen, weekmakers (met name ftalaten en nonylfenolen), etc. Hierbij is hormonale werking nagenoeg uitsluitend een onbedoeld bij-effect. Daarnaast de van nature voorkomende hormonen zoals bijvoorbeeld oestrogenen, het daarvan afgeleide synthetische ethynylestradiol (“de pil”) en oestrogenen gevormd door planten en schimmels (fyto- en myco-oestrogenen). De natuurlijke hormonen hebben in vergelijking met de kunstmatige hormoonverstorende stoffen echter een veel sterkere werking. Voor het vrouwelijk geslachtshormoon oestradiol geldt bijvoorbeeld een “no-effect level” van 7 nanogram per liter! Bij de kunstmatige hormoonverstoorders liggen de “no-effect levels”

veeleer in de ordegrrootte van microgrammen per liter. Voor die natuurlijke hormonen zijn daarom extreem gevoelige analysemethoden nodig. De thans toegepaste stofspectifieke methoden zijn voor die natuurlijke hormonen echter dermate ongevoelig dat directe meting van de actieve stof feitelijk zinloos is. Dit is reden dat RIWA wat Lobith betreft tot eind 2011 heeft gekozen voor effectgerichte meting middels de z.g. Calux-methode. De resultaten daarvan zijn als separate rapportage in 2012 verschenen.

Gedurende het verslagjaar zijn op de onttrekkingspunten Nieuwegein en Nieuwersluis met behulp van de voornoemde Calux voor de oestrogene activiteit vergelijkbare waarden gevonden als die bij Lobith in het voornoemde rapport. Ook de glucocorticoïde activiteit ligt in de grootteorde van de eerder gevonden waarden bij Lobith, hoewel tendentieel ietwat hoger. Het betreft echter nog te weinig waarnemingen om een uitspraak te doen over een eventuele trend.

De rapportagegrenzen van de overige meetmethoden zijn zeer divers en laten te wensen over, rapportagegrenzen groter dan 0,03 µg/l geven immers al snel problemen met de interpretatie in relatie tot de DMR streefwaarde van 0.1 µg/l.

Di(2-ethylhexyl)ftalaat (DEHP) laat hoge gehalten zien, zelfs ondanks de onacceptabele onderste analysegrens van 1,0 µg/l. De hoogste waarneming, bij Lobith is 3,92 µg/l, bij Nieuwegein is dit 3,4 µg/l. De DMR-streefwaarde is ook hier 0,1 µg/l.

Voor Andijk en Nieuwersluis zijn geen resultaten gevonden boven de onderste analysegrens van 1,0 µg/l. Dit wil echter niet zeggen dat de werkelijke gehalten dan ook beneden de DMR-waarden liggen!

### Kunstmatige zoetstoffen

Met name acesulfam wordt in het oppervlaktewater te Lobith in forse gehalten tot 2,4 µg/l aangetroffen, maar het gehele jaar boven de 1,0 µg/l. Omdat de stof in rioolwaterzuiveringen nauwelijks wordt afgebroken heeft de IAWR acesulfam, als representant voor de groep van kunstmatige zoetstoffen bij de ICBR aanhangig gemaakt. Op de onttrekkingspunten binnen Nederland zijn deze stoffen in het geheel niet gemeten, ondanks dat ze deel uit maken van het IAWR meetprogramma. Om die reden bepleit RIWA dan ook nogmaals dringend dat deze groep van stoffen structureel in de meetprogramma's bij de onttrekkingspunten wordt opgenomen. Zie de bijlagen 1 tot en met 4.

## RIWA-base

Voor het eerst zijn nu de gegevens separaat opgenomen van hoogfrequente metingen, zie de parametergroep “Dagelijkse screening / (semi)online meetnet”. Zie de bijlagen 1 t/m 4 achterin dit rapport.

Er is een rapport “30 jaar RIWA-base” beschikbaar voor de totale beschrijving van alle functionaliteit die in de RIWA-base is geïmplementeerd. Zie hiervoor onze website.

## De RIWA-base ten dienste van derden

Steeds meer personen en instanties weten de RIWA-base te vinden en te waarderen. Ook in 2012 is vanuit vele instanties opnieuw een beroep gedaan op de zeer uitgebreide datareeksen in de RIWA-base. De trendanalyses die we kunnen uitvoeren op de datareeksen worden zeer gewaardeerd. Ook de selecties, gemaakt uit meerdere gegevensreeksen per dag, worden zeer gewaardeerd. Aanvragen kwamen ondermeer uit Duitsland en van diverse instanties, die vervolgens op basis van de gegevens rapporteerden over de oppervlaktewaterkwaliteit. Zowel vanuit de RIWA-lidbedrijven als vanuit Nederlandse instituten zoals het Ctgb (College voor de toelating van gewasbeschermingsmiddelen en biociden), KWR (Watercycle Research Institute), RWS (o.a. Waterdienst), RIVM (Rijksinstituut voor volksgezondheid en milieu) en Vewin (Vereniging van waterbedrijven in Nederland) ontvingen we aanvragen voor lange meetreeksen. Diverse universiteiten, onderzoeksbureaus en ook waterschappen hebben inmiddels de weg gevonden naar RIWA database. Alle vragen konden snel en uitgebreid worden beantwoord.

## Nanotechnologie en de watersector

Nanomaterialen worden steeds belangrijker. Ze worden toegepast in alledaagse dingen zoals kleren en verf. Maar ook de industrie gebruikt ze als bijvoorbeeld katalysatoren en in zonnepanelen. Als logisch gevolg worden ook meer nanomaterialen geproduceerd. Juist om deze reden wordt ondertussen veel onderzoek gedaan op het gebied van nanomaterialen in het milieu en hun mogelijke toxische eigenschappen. In Nederland gebeurt dit onder andere in het kader van NanoNext.

### Inleiding

Nanomaterialen zijn materialen met tenminste één dimensie of meer tussen de één en 100 nm (Figuur 1). In het algemeen is er sprake van nanodeeltjes en -materialen als deze bewust door de mens gemaakt zijn. Nanodeeltjes komen echter ook in de natuur voor. Nanodeeltjes zijn aangetoond in bijvoorbeeld gletsjers en maken deel uit van de atmosferische stof. De hoeveelheden in de atmosfeer overtreffen de hoeveelheid door de mens gemaakte nanodeeltjes aanzienlijk. Tegenover productiehoeveelheden van enkele tienduizenden tonnen per jaar staan miljoenen tonnen van nature voorkomende nanodeeltjes in de atmosfeer. Er wordt verwacht dat in 2015 meer dan 2 miljoen mensen wereldwijd in de “nanotechnologie sector” zullen werken en rond 7 miljoen mensen indirect voor deze sector werken. De te verwachten omzet ligt rond \$1 triljoen ( $10^{18}$ ). Er zijn ramingen dat in 2025 alleen al in de VS rond 2,5 miljoen ton  $n\text{TiO}_2$  wordt geproduceerd. Deze cijfers maken duidelijk dat nanotechnologie een belangrijke rol zal spelen in de toekomst.

De bovengenoemde definitie laat drie verschillende categorieën van nanomaterialen toe, namelijk nanoplaatjes zoals grafeen, nanovezels zoals koolstofnanobuisjes en nanodeeltjes zoals zilver nanodeeltjes, met respectievelijk 1, 2, en 3 dimensies kleiner dan 100 nm.

Naast onderscheid op basis van dimensies, is de chemische samenstelling een belangrijk onderscheidingscriterium. Hierin zijn voornamelijk metalen (Ag, Au), metaaloxides ( $\text{TiO}_2$ , ZnO,  $\text{Fe}_2\text{O}_3$ ) en op koolstof gebaseerde nanodeeltjes (fullerenen, koolstofbuisjes) te onderscheiden. Daarnaast bestaan er nog metaalsulfides (bijvoorbeeld cadmiumsulfide quantum dots) en nanodeeltjes die bestaan uit mengsels van verschillende materialen zoals  $\text{SiO}_2$  coatings op  $\text{CeO}_2$  deeltjes. Het ene nanodeeltje is dus het andere niet. Ze verschillen dan ook sterk in hun gebruik, verspreiding en eigenschappen.

De fysisch-chemische eigenschappen van nanodeeltjes zijn afhankelijk van hun dimensies en de samenstelling. Voor het gedrag van nanodeeltjes in het milieu is informatie over de grootte en chemische samenstelling daarom cruciaal. De meest belangrijke eigenschappen van nanodeeltjes zijn in Figuur 2 weergegeven.

*Figuur 1: Nanodeeltjes in vergelijking met andere dingen.*

Deze eigenschappen van nanodeeltjes kunnen aanmerkelijk verschillen. Maar één eigenschap hebben alle nanodeeltjes gemeen: ze hebben allemaal een groot oppervlak ten opzichte van hun volume. Dit zorgt ervoor dat ze zich anders gedragen dan de respectievelijke bulk materialen. Als je bijvoorbeeld CeO<sub>2</sub> nanodeeltjes (7-25 nm) bekijkt, dan hebben deze een oppervlakte van ruim 76 m<sup>2</sup>/g waartegenover CeO<sub>2</sub> deeltjes met een grootte van 200 – 600 nm slechts een oppervlakte van 3 m<sup>2</sup>/g hebben. De hoeveelheid oppervlakteatomen laat dit effect nog duidelijker zien. Als je GaAs nanodeeltjes bekijkt dan zie je dat het aantal atomen op het oppervlakte van nanodeeltjes aanzienlijk groter is naarmate hun diameter afneemt (Tabel 1).

Dus, hoe kleiner een deeltje is hoe meer oppervlakte per gram. Juist om deze reden zijn nanodeeltjes zo interessant voor de industrie, bijvoorbeeld voor toepassing als katalysatoren. Door het grote specifieke oppervlak krijgen nanomaterialen speciale eigenschappen, en dit leidt tot de verwachte toename van het gebruik en toepassingen van nanomaterialen in industriële producten en processen.

Figuur 2: Eigenschappen van nanodeeltjes. Vertaald van (Hassellöv and Kaegi 2009)

Tabel 1: Atomen op de oppervlakte en percentage van atomen op de oppervlakte van verschillende GaAs nanodeeltjes.

| Grootte [nm] | Aantal atomen      | Aantal oppervlakte atomen | Percentage oppervlakte atomen |
|--------------|--------------------|---------------------------|-------------------------------|
| 1.13         | 94                 | 48                        | 51.1                          |
| 1.70         | 279                | 108                       | 38.7                          |
| 2.26         | 620                | 192                       | 31.0                          |
| 2.83         | 1165               | 300                       | 25.8                          |
| 3.39         | 1962               | 432                       | 22.0                          |
| 5.65         | 8630               | 1200                      | 13.9                          |
| 8.48         | $2.84 \times 10^4$ | 2700                      | 9.5                           |
| 14.1         | $1.29 \times 10^5$ | 7500                      | 5.8                           |
| 28.3         | $1.02 \times 10^6$ | $3.0 \times 10^4$         | 2.9                           |
| 56.5         | $8.06 \times 10^6$ | $1.2 \times 10^5$         | 1.5                           |

Van (Poole and Owens 2003), Introduction to Nanotechnology

## Nanomaterialen, waarvoor worden ze gebruikt?

Door hun speciale eigenschappen kunnen nanomaterialen in vele innovatieve toepassingen worden gebruikt. Zo worden nanomaterialen - naast toepassingen in de katalyse -, toegepast in bijvoorbeeld kleding, elektronica, voedsel, “drug delivery” systemen, contrast media, zonnebrandcrème, cosmetica, zonnecellen en verf. Verder worden ze gebruikt als halfgeleider, o.a. bij zonnepanelen en LEDs; in de moleculaire biologie of in de medische wetenschap. Hier moeten quantum dots, zoals cadmiumsulfide en cadmiumselenide worden genoemd: nauwkeurig gefabriceerde nanodeeltjes van halfgeleidermateriaal met zeer stabiele intense fluorescentie die bijvoorbeeld in de kankerdiagnostiek ingezet kunnen worden. Ook zijn er toepassingen van nanomaterialen beschreven voor het gebruik in waterzuivering. Kortom, niet alleen in de wetenschap of in de industrie kunnen we nanodeeltjes verwachten, maar ook in ons dagelijks leven spelen ze een rol. Of het echter nu altijd noodzakelijk of verstandig is nanodeeltjes toe te passen is nog niet duidelijk. Zo worden zilver nanodeeltjes toegepast in sokken, deodorant en zelfs wasmachines omdat zilverionen bekend staat om hun antibacteriële effect. Voldoende hoeveelheden zilverionen kunnen misschien ook met bulk zilver bereikt worden.

Zoals boven beschreven worden nanodeeltjes ook gebruikt in verf. Hiervoor wordt voornamelijk  $\text{TiO}_2$  ingezet, maar ook zilver nanodeeltjes kunnen daarvoor worden gebruikt. Tevens wordt  $\text{TiO}_2$  gebruikt in zonnecrème als filter voor het ultraviolette licht. De  $\text{TiO}_2$  nanodeeltjes zijn verantwoordelijk voor de witte kleur, net als in verf. Daarnaast wordt  $\text{CeO}_2$  gebruikt als additief in dieselbrandstof om schadelijke stoffen af te breken. Naast deze toepassingen in consumentenproducten worden nanodeeltjes ook ingezet in elektronica en zonnepanelen. Een lijst met een selectie van nanodeeltjes en hun toepassingen inclusief productiehoeveelheden is te vinden in Tabel 2.

*Tabel 2: Toepassingen en schattingen van productievolumen van nanodeeltjes (Gottschalk and Nowack 2011, Piccinno et al. 2012)*

| Nanodeeltje          | Toepassingen   | Productievolumen in t/jaar (wereldwijd) |
|----------------------|--|---|
| $\text{nCeO}_2$      | Brandstof, UV blokker  | 55                                      |
| $\text{nAg}$         | Verf, cosmetica, reinigingsmiddelen, kleding, consumer electronics, medicijnen | 55                                      |
| $\text{nTiO}_2$      | Cosmetica, zonnebrandcrème, verf, coatings                                     | 3000                                    |
| $\text{nZnO}$        | Verf, cosmetica  | 550                                     |
| Fullerenen           | Zonnepanelen   | 1                                       |
| Koolstof nanobuisjes | Polymeeradditief   | 300                                     |
| $\text{nSiO}_2$      | Elektronica  | 5500                                    |

## Analytische methoden

Er bestaan verschillende analysemethoden om nanomaterialen te identificeren en concentraties in media te bepalen. Elk methode heeft zijn voordelen en nadelen. Verder kan niet elke methode alle eigenschappen van een nanodeeltje bepalen (Tabel 3).

De meest bekende methode is transmission electron microscopy (TEM). Met deze techniek kan men de nanodeeltjes visueel weergeven en op deze manier niet alleen hun grootte bepalen maar ook de vorm en agglomeratietoestand. Naast deze voordelen zijn er echter ook grote nadelen aan deze techniek verbonden, namelijk de kosten, de tijd, de gevoeligheid en het feit dat ze geen kwantificeerbare data oplevert. Bij zeer lage concentraties is het onmogelijk de nanodeeltjes te vinden. Je moet dan spreekwoordelijk de speld in de hooiberg zoeken. Daarom is de methode niet geschikt voor toepassing in meetcampagnes, waar zeer lage concentraties verwacht worden.

Als alternatief kan dynamic light scattering (DLS) worden gebruikt. Deze methode biedt weliswaar geen beeld van de nanodeeltjes maar op goedkopere en snellere manier kan informatie worden verkregen over de grootte van de deeltjes. Wel zijn hier de nadelen dat er geen informatie over de vorm van het nanodeeltje wordt verkregen en dat de methode relatief ongevoelig is waardoor je alleen bij hoge concentraties deze techniek kan toepassen. Bovendien weet je ook niet welk nanodeeltje je meet. Om deze informatie te krijgen is het nodig het monster door middel van bijvoorbeeld massaspectrometrische technieken te analyseren. Op deze manier kan de samenstelling van het deeltje worden achterhaald. Deze technieken kunnen echter niet zo eenvoudig de grootte van een deeltje vergeven. Om dit laatste te bereiken kan bijvoorbeeld “field flow fractionation” (FFF) worden ingezet, waarmee de deeltjes op basis van hun grootte worden gescheiden en dan te analyseren met massaspectrometrie.

Dit maakt duidelijk dat een combinatie van verschillende fysische en chemische meetmethoden voor nanodeeltjes informatie kan geven over grootte, vorm, agglomeratietoestand en chemische samenstelling.

Tabel 3 laat beknopt zien welke verschillende analysemethoden er voorhanden zijn voor de analyse van nanodeeltje en welke informatie elke techniek oplevert.

Tabel 3: Belangrijkste meetmethoden voor nanodeeltjes

| Methode   | Concentratie | Grootte | Grootte verdeling | Oppervlakte lading | Vorm | Agglomeratie | Compositie |
|-----------|--------------|---------|-------------------|--------------------|------|--------------|------------|
| ICP-MS    | X            |         |                   |                    |      |              | X          |
| SP-ICP-MS | X            | X       | X                 |                    |      |              | X          |
| UV-VIS    | X            | X       |                   |                    |      |              |            |
| TEM       |              | X       | X                 |                    | X    | X            |            |
| DLS       |              | X       | X                 | X                  |      |              |            |
| FFF       |              | X       | X                 |                    |      |              |            |
| MALS      | X            | X       | X                 |                    |      |              |            |
| LC-MS     | X            |         |                   |                    |      |              | X          |

*ICP-MS = Inductive coupled plasma mass spectrometry, SP-ICP-MS = Single Particle ICP-MS, TEM = Transmission electron microscopy, DLS = Dynamic light scattering, FFF = Field Flow Fractionation, MALS = Multiangle light scattering, LC-MS = Liquid chromatography – mass spectrometry*

### Voorkomen van nanodeeltjes in de waterketen

Het gebruik van nanodeeltjes in consumentenproducten kan leiden tot emissies in de waterketen. Fullerenen worden al aangetroffen in nanogrammen per liter en voor andere nanodeeltjes zijn voorspellingen gedaan op basis van aannames. Deze modellen zijn nodig omdat er nog niet voldoende informatie is over emissie en de aanwezigheid van nanodeeltjes in het milieu. Verschillende onderzoekers hebben laten zien dat nanodeeltjes vrijkomen bij wassen van kleding of het gebruik en afspoelen van zonnebrandcrème. Ook het gebruik in auto's draagt hieraan bij omdat  $\text{CeO}_2$  nanodeeltjes door de uitlaat vrijkomen. Hierdoor komen deeltjes vaak eerst in de lucht terecht en kunnen vervolgens uitregenen en in bodem en in het oppervlaktewater terecht komen. Dit geeft aan dat bij het onderzoeken van risico's van nanodeeltjes niet alleen aan blootstelling via water, bodem of voedsel moet worden gekeken, maar ook naar blootstelling via de lucht. In Figuur 3 zijn de diverse mogelijkheden weergegeven hoe nanodeeltjes in het milieu terecht kunnen komen en hoe ze zich daar verder verplaatsen.

Soms is een bron vrij precies aan te wijzen, zoals bepaalde bedrijven of vuilnishopen, maar de emissie kan ook meer diffuus plaatsvinden, bijvoorbeeld door afslijting van materialen die nanodeeltjes bevatten, zoals verf. Nanodeeltjes kunnen per ongeluk of met opzet in het milieu belanden, en zijn dan op diverse plekken te vinden. Er zijn geen uitzonderingen waar je ze niet kunt aantonen: in de lucht, de bodem, het water, in dieren en mensen. En omdat alles met elkaar is verbonden is de kans groot dat de deeltjes van plek tot plek migreren.

Nanodeeltjes kunnen in het milieu ook veranderen. Sommige kunnen oplossen of chemische reacties ondergaan. Zilver nanodeeltjes kunnen bijvoorbeeld zilverionen afgeven en deze kunnen dan omgezet worden naar  $\text{Ag}_2\text{S}$  of  $\text{AgCl}$ . Nanodeeltjes kunnen ook aggregeren (grotere deeltjes vormen). Dit kan gebeuren met dezelfde deeltjes (homoaggregatie) of met andere deeltjes, zoals natuurlijk organisch materiaal, kleideeltjes of andere nanodeeltjes (heteroaggregatie). Hierdoor worden ze groter en meestal minder mobiel. Desondanks kunnen ze nog steeds worden opgenomen door dieren en op deze manier in de voedselketen terecht komen. De volgende lijst laat nog eens de meest belangrijke processen zien die een nanodeeltje kan ondergaan.

- **Homoaggregatie**
- **Heteroaggregatie**
- **Oplossing**
- **Chemische reactie**
- **Adsorptie**

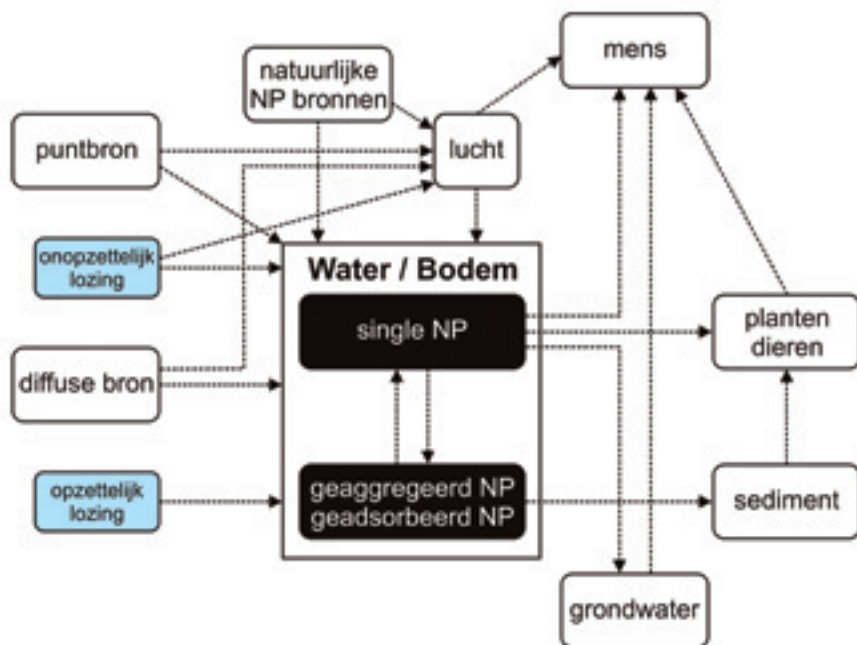

Elk nanodeeltje kan deze processen in principe ondergaan. De matrix (lucht, water, bodem), temperatuur, aanwezigheid van organisch materiaal, zouten, pH, concentratie en UV-licht en de eigenschappen van het deeltje zelf bepalen wat precies met het deeltje gebeurt. Om deze reden zal een nanodeeltje zich in de ene matrix anders gedragen dan in de andere.

### Nanodeeltjes in het milieu, en nu?

Zoals bij de introductie van elke nieuwe technologie of van nieuwe materialen, zijn er zorgen over de veiligheid van deze materialen voor mens en milieu. Zeker nu nanotechnologie op steeds meer terreinen wordt toegepast, en nanodeeltjes dus in het milieu terecht kunnen komen, is het begrijpen en analyseren van de risico's van nanotechnologie van groot belang.

*Figuur 3 Verspreiding van nanodeeltjes in het milieu vertaald en aangepast van (Nowack and Bucheli 2007)*

Het is dus de vraag hoe toxisch nanodeeltjes eigenlijk zijn voor de natuur en de mens. Voor een aantal nanodeeltjes zoals Ag, TiO<sub>2</sub> en C<sub>60</sub> zijn er inmiddels veel artikelen verschenen over hun gedrag in het milieu en hun toxiciteit. Maar er is nog maar weinig bekend over toxiciteit en blootstelling.

Verschillende nanodeeltjes gedragen zich ook verschillend en naar verwachting zal ook de toxiciteit onderling verschillen. De grootte heeft hier invloed maar ook de compositie van het deeltje. Dit blijkt bijvoorbeeld bij vergelijking van de effecten van ZnO en TiO<sub>2</sub>. Blootstelling

aan het eerste leidt tot 100% mortaliteit bij bepaalde bacteriën, terwijl titaanoxide geen negatieve effecten heeft. Bij dit onderzoek bleek de oorzaak van de toxiciteit het adsorberen van de nanodeeltjes op de celmembranen te zijn. Ook ander onderzoek, met  $\text{CeO}_2$ , liet zien dat nanodeeltjes aan de membranen van cellen adsorberen en op deze manier de gewone cel-activiteit verstoren. Naast de fysische toxiciteit kunnen er nog twee andere oorzaken zijn voor toxiciteit. Ten eerste kunnen nanodeeltjes ionen afgeven die giftig zijn. Het bekendste voorbeeld hiervan is  $\text{Ag}^+$ . De antibacteriële effecten van zilverionen zijn al lang bekend en zijn ook voor zilver nanodeeltjes van toepassing. Daarnaast speelt de katalytische activiteit van de deeltjes een rol. Deze zijn namelijk in staat om met behulp van licht “reactive oxidative species” (ROS) te vormen. ROS zijn zuurstof- en hydroxyl-radicalen die worden gevormd door elektronen die vrijkomen bij de bestraling met licht. Deze radicalen reageren gemakkelijk met andere stoffen en kunnen op deze manier de stofwisseling in een cel belemmeren. Naast deze indirecte manier kunnen elektronen, die vrijkomen door bestraling van nanodeeltjes met licht, ook direct met organische stoffen reageren en deze omzetten tot andere stoffen als ze op de oppervlakte van het nanodeeltje geadsorbeerd zijn.

### Nanodeeltjes in de (afval)waterzuivering

Het is van belang om te begrijpen hoe nanodeeltjes zich in de waterzuivering gedragen. Hierbij spelen drie vragen. Ten eerste of (afval)waterzuiveringsinstallaties in staat zijn nanodeeltjes uit het water te halen, ten tweede of ze geen last hebben van de nanodeeltjes en ten derde of nanodeeltjes misschien nuttig kunnen worden toegepast in een waterzuiveringsstap.

Meerdere experimenten laten zien dat 94 tot 97 % van bepaalde nanodeeltjes uit het afvalwater kunnen worden verwijderd. Ze adsorberen voornamelijk aan het slib. Maar dit geldt niet voor alle nanodeeltjes. Terwijl  $\text{CeO}_2$  en  $\text{Al}_2\text{O}_3$  goed adsorberen, doet  $\text{SiO}_2$  dit niet. Het is dus belangrijk om de verschillende soorten nanodeeltjes apart te bekijken. Ook is aangetoond dat nanodeeltjes in de rioolwaterzuivering chemisch kunnen veranderen. Ag-nanodeeltjes worden bijvoorbeeld omgezet naar  $\text{Ag}_2\text{S}$ . Dit gebeurt voornamelijk in het niet-beluchte gedeelte van de zuivering. Zowel in het slib als in het effluent wordt  $\text{Ag}_2\text{S}$  gevonden.

Verder is de vraag belangrijk of de bacteriën in het actieve slib last hebben van de nanodeeltjes. Eerder onderzoek liet zien dat nanodeeltjes effect kunnen hebben op bacteriën. Ook eerste experimenten met nanodeeltjes zoals  $\text{TiO}_2$ , Ag, Au en  $\text{CeO}_2$  toonden negatieve effecten aan

voor de bacteriën. De hierbij gebruikte concentraties waren echter vrij hoog, namelijk rond 500 mg/L. Experimenten met enkele µg/L en zelfs 55 mg/L nanodeeltje toonden aan dat de bacteriën nog steeds hun werk konden verrichten.

Deze resultaten maken duidelijk dat het mogelijk is nanodeeltjes in de (afval)waterzuivering toe te passen. Hierbij kunnen hun katalytische eigenschappen gebruikt worden. Ze kunnen bijvoorbeeld worden ingezet bij de afbraak van schadelijke en giftige organische verbindingen. Om nanodeeltjes toe te kunnen voegen is het wel belangrijk van tevoren te testen of deze schadelijk zijn voor de bacteriën in het actieve slib. Verder is het uiteraard van belang vast te stellen dat de deeltjes dan niet via het effluent van de zuiveringsinstallatie in het milieu terecht kunnen komen.

Er wordt in de literatuur ook veel onderzoek beschreven naar de toepassing van nanodeeltjes als fotokatalysatoren in drinkwaterzuivering. TiO<sub>2</sub> deeltjes kunnen erg effectief zijn voor de omzetting van bijvoorbeeld organische microverontreinigingen in drinkwater, maar daarvoor is wel een hoog specifiek oppervlak vereist. Nanodeeltjes zouden hiervoor kunnen worden toegepast, maar dan moet wel gegarandeerd kunnen worden dat ze vervolgens niet in het drinkwater terechtkomen.

### Nanodeeltjes out of REACH?

Nanodeeltjes vallen in principe onder de Europese verordening voor chemische stoffen REACH. Ze behoren bij de categorie 'stoffen' en daardoor gelden de algemene regels van REACH ook voor nanodeeltjes, ongeacht hun grootte, vorm en fysische toestand. Deze eigenschappen moeten worden vermeld bij de registratie van het materiaal. Voor nanodeeltjes geldt dat de vorm en grootte een belangrijke invloed heeft op de eigenschappen, gedrag en toxiciteit. Desalniettemin zijn nanomaterialen en specificaties van hun dimensies niet genoemd in de REACH regelgeving. Zoals de Europese Commissie het in 2011 verwoorde: "There are no provisions in REACH referring specifically to nanomaterials. However, REACH deals with substances, in whatever size, shape or physical state. Substances at the nanoscale are therefore covered by REACH and its provisions apply. It thus follows that under REACH, manufacturers, importers and downstream users have to ensure that their nanomaterials do not adversely affect human health or the environment."

Een rapport van het Center for International Environmental Law maakt duidelijk dat de situatie met nanomaterialen niet zo eenvoudig is. Drie aspecten van de regelgeving worden genoemd die het lastig maken nanodeeltjes door REACH te laten beoordelen.

- 1 Een grote hoeveelheid nanomaterialen kan zonder registratie de Europese markt binnenkomen tot 2018, met name stoffen die ook in bulk kunnen bestaan. Dit geldt minder voor bijvoorbeeld fullerenen.
- 2 Chemicaliën moeten worden geregistreerd vanaf een bepaalde hoeveelheid (productie of import), maar de meeste nanomaterialen worden alleen maar op kleine schaal geproduceerd.
- 3 Aan de bijzondere eigenschappen van nanomaterialen wordt geen aandacht besteed.

Tot 2018 hoeven chemicaliën met een productie- of importvolume in/naar Europa beneden de 100 t/jaar niet te worden geregistreerd. Uit Tabel 2 blijkt dat veel gebruikte nanodeeltjes zoals CeO<sub>2</sub>, Ag en fullerenen niet aan dat criterium voldoen en tot die tijd niet hoeven worden gemeld en beoordeeld. Er zijn nog veel meer nanomaterialen waarvan het productievolume zeker onder de 1 t/jaar zal blijven waardoor ze ook na 2018 “out of REACH” zijn.

Naast deze problemen in het kader van REACH zijn er nog problemen met het beoordelen van nanodeeltjes met betrekking tot toxiciteit. Er zijn nog geen algemeen geldende regels hiervoor. Daardoor is het lastig hun effecten goed in te kunnen schatten. Er is ondertussen een REACH Implementation Project on Nanomaterials opgestart (RIPoN). Het eerste rapport RIPoN 1 maakt duidelijk dat nanomaterialen op basis van hun compositie worden beoordeeld maar hun grootte verder niet wordt bekeken. Daarom wordt nu onderzocht hoe deze variabele toegevoegd kan worden. Want zoals eerder in dit hoofdstuk genoemd heeft de grootte van een deeltje invloed op het gedrag en mogelijk ook op de giftigheid.

## CONCLUSIE

Samenvattend kan worden gezegd dat er nog veel werk staat te wachten voordat we effecten van nanodeeltjes enigermate zullen kunnen begrijpen en beoordelen. Naar verwachting zullen nanodeeltjes, door het brede toepassingsgebied en een sterke groei van de markt, meer gaan voorkomen in het milieu. Het is dan ook belangrijk om de risico's die hieraan verbonden zijn in kaart te brengen. Er is veel onderzoek gedaan, maar zowel onderzoek naar de analysemethoden als de invloed van nanodeeltjes op het milieu staan nog in de kinderschoenen. Bovendien is de regelgeving voor risk assessment in ontwikkeling.

Relevant voor de watersector zijn in het bijzonder zowel de verwachte toenemende concentraties in bronnen voor drinkwater als de verwachte kansen wat betreft nuttige toepassing in zuiveringsmethoden.

## Lopende en nieuwe onderzoeksprojecten

Zoals in eerdere jaarrapporten reeds is aangegeven, worden onderzoeksvraagstellingen bij de lidbedrijven bij voorkeur ondergebracht in het BTO, het bedrijfstak-onderzoek. Het kan echter voorkomen dat specifieke vraagstellingen buiten de scope van dat BTO vallen, bijvoorbeeld omdat ze sterk beleidsondersteunend zijn, of onvoldoende draagvlak krijgen omdat ze slechts voor een deel der bedrijven relevant zijn. In dergelijke gevallen kan, apart van de reguliere begroting, budget worden gereserveerd om dergelijke vraagstellingen onder de vlag van RIWA-Rijn te onderzoeken.

In het verslagjaar zijn twee van dergelijke onderzoeken gestart: een screening naar de aanwezigheid van antibiotica in oppervlaktewater en een literatuurstudie naar MRI-contraststoffen.

### Antibiotica

Antibiotica worden wijdverbreid en in grote hoeveelheden toegepast in veeteelt en humane geneeskunde. Net als bij andere geneesmiddelen zal een deel na inname – al dan niet ongewijzigd – weer worden uitgescheiden en dus via rioolwaterzuiveringen dan in het oppervlaktewater terecht komen. Toch is over het voorkomen van antibiotica in oppervlaktewater nog erg weinig bekend. Eerder is, onder andere door RWS-Waterdienst een methode ontwikkeld om de werking van groepen antibiotica aan te tonen in monsters oppervlaktewater van de Maas. De methode doet sterk denken aan de oorspronkelijke ontdekking van penicilline door Alexander Fleming: een schimmel-besmetting op een egaal met bacteriën begroeide agarplaat die tot “plaques” (gaten in die laag) leidde door afsterven van de bacteriën rondom de schimmel als gevolg van de afgescheiden penicilline.

Bij de door RWS-Waterdienst ontwikkelde methode wordt op een vijftal groepen van antibiotica getest, te weten macroliden, sulfonamiden, tetracyclinen, aminoglycosiden en chinolonen. Eerdere bevindingen waarbij deze methode werd ingezet op monsters uit de Maas wezen uit dat met name macroliden-activiteit werd aangetroffen, met in mindere mate tetracyclinen en aminoglycosiden.

In het huidige onderzoek worden de lokaties Lobith en Nieuwgein gedurende het verslagjaar elk 13 maal bemonsterd.

## MRI-contrastmedia

Röntgencontrastmedia worden veel ingezet. Vanwege hun polariteit en inertie komt het grootste deel uiteindelijk in het oppervlaktewater terecht. Gehalten ter hoogte van Lobith liggen momenteel al rond de 0,5 µg/L. Inmiddels beginnen in de wetenschappelijke vakliteratuur publicaties te verschijnen over MRI-contrastmedia: ook deze worden steeds vaker ingezet en ook deze stoffen zijn tamelijk polair en inert. Dit betreft vnl complexe organische verbindingen met een centraal gadoliniumatoom. De indruk is ontstaan dat via dit atoom de MRI-contrastmedia op indirecte wijze gemeten (kunnen) worden. KWR zal in 2012 aan de ontwikkeling van een mogelijk inzetbare methode werken. Een complicerende factor is dat gadolinium ook van nature voorkomt, zodat feitelijk eerst een “natuurlijke achtergrond” vastgesteld moet worden, wil via Gd-metingen een eventuele stijging tgv MRI-middelen kunnen worden aangetoond. Achtergrondverhoudingen tussen Gd en andere zeldzame aarden zijn bij Waterdienst/Deltaris overigens reeds onderwerp van studie. In het drinkwater van Berlijn is (weliswaar in lage gehalten) gadolinium reeds aangetoond (en heeft de media gehaald): daar ontbrak echter informatie over een natuurlijke achtergrond, waardoor de publiciteit onvoldoende ontkracht kon worden. Eerste meetwaarden in Rijnwater van gadolinium geven gehalten rond 60 ng/L. Het lijkt derhalve van belang om snel inzicht te krijgen in de mogelijke relevantie van deze stofgroep voor de waterbedrijven.

De gedurende het verslagjaar uitgevoerde desktopstudie beoogt inzicht te geven in de aard van de stoffen, de mate van inzet en schattingen van mogelijk toekomstig in het Rijnwater te verwachten gehalten, toepasbare analysemethoden ed.

## Aanpassing RIWA database

In het vorige jaarrapport is melding gemaakt van een toen gestart onderzoek naar het berekenen, via een neurale netwerk, van ontbrekende gegevens in meetreeksen. Dat behelst een vervolgonderzoek op het in 2010 verschenen rapport over röntgencontrastmiddelen. Daarbij werd echter ook aangetekend dat dat vervolgonderzoek vertraging had opgelopen omdat voorrang gegeven moest worden aan de overschakeling op een nieuwere versie van de kantoorautomatisering.

In 2012 heeft dit onderzoek gelukkig wél de nodige voortgang gekend. Inmiddels zijn verschillende algoritmen getest en zijn enkele software-varianten getest, waaronder het zg. Random Forest model. Zo is de prestatie beoordeeld, zowel bij toepassing op gesimuleerde

reeksen als bij toepassing op een doorsnee van meetreeksen uit RIWA-base. Daaruit bleek duidelijk dat Random Forest doorgaans het best presteerde en bijvoorbeeld in meer dan de helft van de gevallen een ontbrekende waarde kon imputeren met een fout van minder dan 5%. De grotere fouten die echter óók werden gevonden, bleken doorgaans samen te hangen met uitbijters en foutief gemeten waarden, die ondanks alle voorzorgen door de laboratoria zijn aangeleverd en vervolgens door RIWA zijn verwerkt. Random Forest kan daarom ook assisteren in het opsporen van dergelijke anomalieën.

Van alle drie voornoemde onderzoeken zal naar verwachting omstreeks de zomer van 2013 een rapportage verschijnen.

## Verschenen rapporten

In dit hoofdstuk worden de rapporten weergegeven die in het verslagjaar zijn gepubliceerd. Alle rapporten staan ook op de RIWA-website ([www.riwa-rijn.org/publicaties](http://www.riwa-rijn.org/publicaties)) waar ze gratis kunnen worden gedownload.

Met het oog op kostenbesparingen worden de rapporten als sinds 2003 niet meer in brede oplage verspreid, maar is gekozen voor zogenaamde attentiekaartjes met een korte beschrijving van de resultaten. De rapporten zelf kunnen uiteraard nog steeds bij RIWA-Rijn worden opgevraagd, zowel als pdf als in de originele gedrukte vorm.

Gedurende het verslagjaar is bovendien een serie eerdere rapporten opnieuw uitgegeven als pdf. Het betreft rapporten van vóór 2003. Van deze rapporten waren oorspronkelijk wél gedrukte exemplaren geproduceerd, maar als gevolg van de toenmalige druktechniek zijn deze niet meer na te leveren. Van veel van die rapporten bleef echter de vraag onverminderd hoog. Daarom is ervoor gekozen om de resterende exemplaren in de RIWA bibliotheek te bewaren en in plaats daarvan pdf-versies op de website beschikbaar te maken. Daarnaast is van elk van die rapporten een attentiekaartje gemaakt.

Het voert te ver om voor elk van deze uitgaven de integrale tekst van de attentiekaartjes over te nemen. Daarom wordt voor die her-uitgaven volstaan met de weergave van de titels en het jaar van oorspronkelijke publicatie.

Wél wordt onderstaand de integrale tekst weergegeven voor de nieuwe uitgaven in het verslagjaar.

### Evaluatie van de brede screening van stoffen in de Rijn bij Lobith (2010 – 2011)

Op de locatie Lobith is een brede screening uitgevoerd waarmee een beeld is verkregen van het voorkomen van organische verontreinigende verbindingen in de Rijn. In 2010 en 2011 zijn vierwekelijks monsters genomen die geanalyseerd zijn met de XAD-GC/MS-methode. In totaal zijn in de brede screening 233 bekende en 142 onbekende verbindingen aangetroffen. Per monster ligt de som van de concentraties tussen de 0.05 en 5.89 µg/L. De som van concentraties is significant gecorreleerd aan het debiet van de Rijn bij Lobith.

Op basis van de screeningsresultaten is een selectie gemaakt van potentieel relevante stoffen waarvoor aansluitend een toxicologische evaluatie zal worden uitgevoerd. Hierbij zijn de volgende selectiecriteria toegepast:

- A. Verbindingen worden in meer dan 25% van de monsters aangetoond met een hoogste concentratie boven de 0.1 µg/L.
- B. Verbindingen worden zeer frequent aangetoond (in meer dan 75% van de monsters) met een hoogste concentratie tussen de 0.01 en 0.1 µg/L.
- C. De geselecteerde verbindingen worden ook aangetroffen in het screeningsonderzoek van het IJsselmeer (Andijk), Lekkanaal (Nieuwegein) of Amsterdam-Rijnkanaal (Nieuwersluis).
- D. Voor de stoffen is nog geen toxicologische evaluatie uitgevoerd.

Elf bekende stoffen voldoen aan bovenstaande criteria, te weten: 1-(2-methoxypropoxy)-2-propanol; 2,2,6,6-tetramethyl-4-piperidinon; 2,4-di-dimethylpropylfenol; 5-methylcarbamothioaat; sultiame; triisobutylfosfaat; trimethylazidocyclohexeen; tri(1,3-dichloor-2-propanol)fosfaat; tramadol; indaan en tri(2-chloorethyl)fosfaat.

#### **Evaluatie van hormonale activiteit gemeten in de Rijn bij Lobith (2010 – 2011)**

Om een integraal beeld te krijgen van de kwaliteit van het oppervlaktewater, kunnen naast chemische screenings ook effectgerichte bioassays ingezet worden. Met behulp van deze assays is het mogelijk om effecten te meten van de complexe mengsels aan verontreinigende stoffen die aanwezig zijn in het water. In deze studie zijn bioassays uitgevoerd, waarmee vierwekelijks in 2010 en 2011 twee eindpunten gemeten zijn die relevant zijn voor de humane gezondheid: oestrogene activiteit gemeten met de ER-CALUX en glucocorticoïde activiteit gemeten met de GR-CALUX.

Uit de resultaten blijkt dat de oestrogene activiteit in de Rijn bij Lobith laag ligt met waarden onder de 0.2 ng estradiol-equivalenten per liter (E2-eq/L). Een uitzondering hierop zijn twee piekconcentraties van 0.4 en 0.8 ng E2-eq/L in de zomer van 2010.

Alle waarden liggen onder de toxicologische trigger van 7 ng E2-eq/L. De gemeten oestrogene activiteit in het oppervlaktewater van de Rijn vormt daarom geen bedreiging voor de kwaliteit van het drinkwater. In de GC-MS/MS screeningsresultaten van Lobith konden geen specifieke stoffen gevonden worden die duidelijk de verhoogde oestrogene activiteit in de zomer van 2010 verklaren.

De glucocorticoïde activiteit lag slechts in 23% van de monsters boven de detectielimiet van 1,5 ng DEX-eq/L. Maximale waarden lagen rond de 12 ng DEX-eq/L. Het gezondheidsrisico voor chronische blootstelling aan een lage dosis glucocorticoïden is onbekend. Het was niet mogelijk om stoffen te identificeren die verantwoordelijk zijn voor de gevonden glucocorticoïde respons.

Een seizoenstrend kon noch voor oestrogene, noch voor glucocorticoïde activiteit worden bevestigd gebaseerd op meetgegevens van 2004 t/m 2011.

### 30 jaar RIWA-base

Het waterkwaliteitsmeetnet dat RIWA beheert, omvat een groot aantal meetlocaties waar reeds jarenlang een uitgebreide reeks van parameters wordt onderzocht. De gegevens worden opgeslagen in en verwerkt vanuit een database, RIWA-base genaamd. Anno 2012 zijn in die RIWA-base ongeveer 2,4 miljoen gegevens opgeslagen, bestaande uit ruim 11500 meetreeksen. Via deze meetgegevens wordt inzicht verkregen in de ontwikkeling van de kwaliteit in de loop van de tijd en kan worden beoordeeld in hoeverre bijvoorbeeld beleidsmaatregelen bij de overheid effect hebben, of kunnen nieuwe problemen onder de aandacht worden gebracht.

Het is van groot belang dat de ingewonnen informatie uit dit meetnet betrouwbaar is. Daartoe heeft RIWA in de loop der jaren verschillende methodieken ontwikkeld en toegepast. Zo is het ontwerp van het meetnet wat betreft monsternamenfrequenties, statistische evaluatietechnieken e.d. afgestemd op wetenschappelijk erkende richtlijnen, zijn presentatiewijzen ontwikkeld om trends inzichtelijk te maken en zijn zelfs rekenmethoden ontwikkeld om “gaten” in meetreeksen statistisch betrouwbaar te interpoleren.

Alle gehanteerde methoden en werkwijzen zijn uiteraard gedocumenteerd en vele daarvan zijn ook gepubliceerd, met als doel de aanpak transparant te maken voor onze doelgroepen. Deze publicaties zijn echter tamelijk versnipperd en daardoor niet makkelijk toegankelijk. In de publicatie 30 jaar RIWA-base zijn alle gehanteerde methoden en werkwijzen gebundeld, zoals die eerder op verschillende manieren zijn beschreven.

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Rijnwater bij Lobith in 2012**

• o.a.g. = onderste analysigrans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 ■ I = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Rijnwater bij Lobith in 2012**

• o.a.g. = onderste analysagrens • n = aantal waarnemingen per jaar • min = minimum • p10 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Rijnwater bij Lobith in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • † = reeks geheel of gedeeltelijk samengesteld met door neurale netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Rijnwater bij Lobith in 2012**

• o.a.g. = onderste analysegrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Rijnwater bij Lobith in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Rijnwater bij Lobith in 2012**

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • l = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

# Bijlage 2

## De samenstelling van het Lekkanaalwater te Nieuwegein in 2012

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • † = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Lekkanaalwater te Nieuwegein in 2012**

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Lekkanaalwater te Nieuwegein in 2012**

• o.a.g. = onderste analysegrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• I = reeks geheel of gedeeltelijk samengesteld met door neurale netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Lekkanaalwater te Nieuwegein in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • † = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Lekkanaalwater te Nieuwegein in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Lekkanaalwater te Nieuwegein in 2012**

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Lekkanaalwater te Nieuwegein in 2012**

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † I = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

De samenstelling van het Lekkanaalwater te Nieuwegein in 2012

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• I = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysagrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• I = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysegrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• I = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

• o.a.g. = onderste analysegrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysesgrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maankolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het Amsterdam-Rijnkanaalwater te Nieuwersluis in 2012**

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• I = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysegrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysagrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysegrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysesgrens • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• I = reeks geheel of gedeeltelijk samengesteld met door neural network geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysegraans • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
 • † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

**De samenstelling van het IJsselmeerwater te Andijk in 2012**

• o.a.g. = onderste analysegraad • n = aantal waarnemingen per jaar • min = minimum • p10 p50 p90 = percentielwaarden • gem = gemiddelde • max = maximum • \* = onvoldoende gegevens  
• † = reeks geheel of gedeeltelijk samengesteld met door neuraal netwerk geschatte waarden

De waarden in de tabellen onder de diverse maandkolommen kunnen, afhankelijk van de meetfrequentie, zowel enkelvoudige als gemiddelde waarden zijn. Voor de berekening van de statistische kengetallen worden echter altijd de individuele meetwaarden gebruikt. Deze individuele waarden zijn uiteraard bij ons op te vragen.

De samenstelling van het IJsselmeerwater te Andijk in 2012

## RIWApict

### Visualisatie van de resultaten

De gebruikte pictogrammen verdienen enige uitleg. Deze wijze van weergeven heeft een groot voordeel: in één oogopslag is een groot aantal zaken te onderkennen.

De kleur geeft aan hoe het gehalte ligt t.o.v. de DMR-streefwaarden\*:

0 – 79 % van de streefwaarde is blauw 

80 – 99 % van de streefwaarde is geel 

100 en groter is rood 

Geen kleur (wel een symbool) wil zeggen: geen IAWR streefwaarde   

Het symbool geeft aan hoe de trend is:

Met een streep wordt aangegeven dat er, ondanks voldoende meetgegevens, geen trend kon worden aangetoond, óf dat er geen trend is 

Het pijltje geeft de richting van de (significante) trend aan  
(95% 2-zijdig betrouwbaar)  

De kleurvulling geeft aan op hoeveel waarnemingen de uitspraak is gebaseerd:

10 – 19 waarnemingen, het symbool is gekleurd en het vlak is wit 

20 of meer waarnemingen, het symbool is wit en het vlak is gekleurd 

Een leeg vlak wil zeggen dat er geen (of te weinig) meetgegevens zijn,  
we doen daar dus géén uitspraak.
